Bio 111/210/260

### OBJECTIVES

After completion of this experiment, the student Will be able to:

1. Define the following terms, phenotype, genotype, genetic cross, parental generation, first generation, second generation
2. Demonstrate the following skills necessary for genetic problems solving. determining the genotypes using the proper symbols, determining the gametes, produced by the parents in a given cross and determining the genotypes and phenotypes of the children in the next generation
3. Be able to solve problems of complete and incomplete dominance involving monohybrid crosses.
4. Understand the Principle of Independent Assortment.
5. Explain how sex is determined in mammals.
6. Solve problems involving sex-linked genes.

### INTRODUCTION

In sexually reproducing organisms, genetic information is passed from parents to offspring by means of haploid gametes (eggs and sperm) which unite to form a diploid zygote. The zygote receives half of its chromosomes from its father and from its mother. The genotype of the offspring is determined by the type of alleles the parents pass on them, in turn, the alleles present in the offspring will influence the observable traits in the new individuals, given rise to their specific phenotypes.

Motulsky, 2013-06-29 The first edition of this book published in 1979 was found useful by many students and was well received by the scientific community Since the book was first written human genetics has undergone dramatic developments mainly due to the introduction of new concepts and techniques from molecular biology Con comitantly basic scientists have become increasingly interested in problems of human genetics More than 700 human genes have been mapped genes of previously unsuspected complexity such as the gene for factor VIII have become known and the structure of noncoding DNA sequences is being analyzed with the aim of understanding gene regulation DNA diagnosis is being rapidly introduced into medical genetics All this as well as the extensive progress in most

other fields of human and medical genetics had to be considered in the preparation of this second edition. The book has been extensively revised and rewritten. A substantial new section dealing with gene and chromosomal structure at the molecular level has been added. The newer knowledge of molecular genetics has been incorporated and the conceptual and practical contribution of DNA methods for example in the hemoglobinopathies and in some other diseases is discussed. Many new figures and tables have been added and some illustrative material has been replaced. We have read carefully the many friendly and sometimes flattering reviews of the first edition.
