For the design the construction of highway and airfield, it is imperative to carry out tests on construction materials for their scientific designing and cost-minimum. The inherent economy in construction depends upon the maximum use of local materials. The prime objective of the different tests is to know and classify the processed material into different group depending upon their physical and strength or stability characteristics.

Different types of pavements are constructed at a rate for the soft and medium-strength materials of various types of subgrade on the desired speed. All these pavements are laid over a prepared soil surface and surface subgrade. Therefore it is necessary first to test the properties of the subgrade soil and to conduct its supporting capacity. The basic tests needed on the subgrade soil for the design are for the classification and classification of the soil, its density and compressive characteristics. It is also necessary to determine the strength characteristics of the subgrade for the design of pavements. Some of the important tests on subgrade soil are given in Part 2 of this book.

Parameters are classified into two major groups as *facilitative* and *rigid*. The parameter sections which do not fall in any one of these types, are being classified as *semi-rigid* or *semi-facilitative*. Depending upon the technique and the material of construction, the parameters are divided into three broad categories: (a) *Structural* (all Concrete, masonry and steel), (b) *Material* (all Wood, Metal and Plastic), and (c) *Behavioral* (all Composite and wood). The study of road stones are judged by studying their resistance against abrasion, crushing, and weathering action. The other properties of aggregates which are important are their shape factor, specific gravity, water absorption, relative efficiency with bitumen, etc. The important tests on aggregates for use as pavement material have been presented in Part II of this book.

In preparing this document, the aggregates are listed together in a prominent component type with binding agents in the category of miscellaneous materials. The various types of binders used in concrete construction are also included in this category. The uses of these materials are discussed in the sections on cements, lightweights and mortars as treated quite rapidly during the last few decades. With fast developing petroleum industry in India, some bituminous materials would be available for utilization. Physical tests like penetration, ductility, softening point, flash fire point etc., are in use in classifying and testing of bituminous materials. Viscosity test is also indicated in recent years for defining the materials for their asphaltic use. Part III of this book deals with uses of bituminous materials.

Interim design notes are used in the earlier phases of government, and some types of Interim design notes are also used in the later phases of some Florida projects. These interim notes are to be designed to understand the varying conditions of climate and traffic. There are several methods of Interim design notes. Two of the more common methods are given in Part IV of the book.

There are several additional comments that are not included as there are extensively dealt within patent literature through many standard publications.

Values of the tests are listed, respectively, for the various materials and steels as manufactured in different countries, for different agencies/institutions. The test methods used and equipment is given in this book and based on those given by the Indian Standards Committee (1950) and the Indian Bureau of Standards (1956) in the case of tests not covered by the ISI or BSI. The specifications and nomenclatures of various standard organizations is like the British Standards Institution, American Society for Testing Materials, Japanese Standards, etc. have been followed.

Preface to the first edition

Different educational institutions in India have now developed their syllabi wherein testing of highway materials have been included. There is an urgent need of suitable laboratory manual has been felt. This book though, particularly designed for engineering students, deals with the routine tests that the field engineers engaged in paving jobs may also need to know too.

In preparing this manual, authors have extensively used the publications of IIA, ILO, AITAC, and Appleby Institute. The help received from these organizations is gratefully acknowledged here.
