### Conceptual Questions

- 2.17. Velocity and speed are defined differently. The magnitude of average velocity and average speed are the same only when the direction of movement does not change. If the direction changes during movement, it is known that the net displacement is smaller than the net distance. Using the definition of average velocity and speed, it can be said that the magnitude of average velocity is less than the average speed when the direction changes during movement. Here, only Christine changes direction during her movement. Therefore, only Christine has a magnitude of average velocity which is smaller than her average speed.
- 2.18. The acceleration due to gravity is always pointing downward to the center of the Earth.

It can be seen that the direction of velocity is opposite to the direction of acceleration when the ball is in flight upward. The direction of velocity is the same as the direction of acceleration when the ball is in flight downward.

- 2.19. The car, before the brakes are applied, has a constant velocity,  $v_0$ , and zero acceleration. After the brakes are applied, the acceleration is constant and in the direction opposite to the velocity. In velocity versus time and acceleration versus time graphs, the motion is described in the figures below.

- 2.20. There are two cars, car 1 and car 2. The decelerations are  $a_1 = 2a_2 = -a_0$  after applying the brakes. Before applying the brakes, the velocities of both cars are the same,  $v_1 = v_2 = v_0$ . When the cars have completely stopped, the final velocities are zero,  $v_1 = 0$ .  $v_1 = v_0 + at = 0 \Rightarrow t = -\frac{v_0}{a}$ . Therefore, the ratio of time taken

to stop is  $\text{Ratio} = \frac{\text{time of car 1}}{\text{time of car 2}} = \frac{-v_0 / (-a_0)}{-v_0 / \left(-\frac{1}{2}a_0\right)} = \frac{1}{2}$ . So the ratio is one half.
