Digital Image Processing and Analysis Scott E. Umbaugh, 2022-12-30. Digital Image Enhancement, Restoration and Compression focuses on human vision based imaging application development. Examples include making poor images look better, the development of advanced compression algorithms, special effects imaging for motion pictures and the restoration of satellite images distorted by atmospheric disturbance. This book presents a unique engineering approach to the practice of digital imaging which starts by presenting a global model to help gain an understanding of the overall process followed by a breakdown and explanation of each individual topic. Topics are presented as they become necessary for understanding the practical imaging model under study which provides the reader with the motivation to learn about and use the tools and methods being explored. The book includes chapters on imaging systems and software, the human visual system, image transforms, image filtering, image enhancement, image restoration and image compression. Numerous examples including over 700 color images are used to illustrate the concepts discussed. Readers can explore their own application development with any programming language including C, C++, MATLAB, Python and R and software is provided for both the Windows, C++ and MATLAB environments. The book can be used by the academic community in teaching and research with over 1,000 PowerPoint slides and a complete solutions manual to the over 230 included problems. It can also be used for self study by those involved with application development whether they are engineers, scientists or artists. The new edition has been extensively updated and includes numerous problems and programming exercises that will help the reader and student develop their skills.

The Discrete Math Workbook Sergei Kurgalin, Sergei Borzunov, 2020-08-12. This practically focused study guide introduces the fundamentals of discrete mathematics through an extensive set of classroom tested problems.

Each chapter presents a concise introduction to the relevant theory followed by a detailed account of common challenges and methods for overcoming these. The reader is then encouraged to practice solving such problems for themselves by tackling a varied selection of questions and assignments of different levels of complexity. This updated second edition now covers the design and analysis of algorithms using Python and features more than 50 new problems complete with solutions. Topics and features provide a substantial collection of problems and examples of varying levels of difficulty suitable for both laboratory practical training and self study. Offers detailed solutions to each problem applying commonly used methods and computational schemes. Introduces the fundamentals of mathematical logic, the theory of algorithms, Boolean algebra, graph theory, sets, relations, functions, and combinatorics. Presents more advanced material on the design and analysis of algorithms including Turing machines, asymptotic analysis, and parallel algorithms. Includes reference lists of trigonometric and finite summation formulae in an appendix together with basic rules for differential and integral calculus. This hands-on workbook is an invaluable resource for undergraduate students of computer science, informatics, and electronic engineering. Suitable for use in a one or two semester course on discrete mathematics. The text emphasizes the skills required to develop and implement an algorithm in a specific programming language.

Handbook of Data Structures and Applications Dinesh P. Mehta, Sartaj Sahni, 2018-02-21 The Handbook of Data Structures and Applications was first published over a decade ago. This second edition aims to update the first by focusing on areas of research in data structures that have seen significant progress. While the discipline of data structures has not matured as rapidly as other areas of computer science, the book aims to update those areas that have seen advances. Retaining the seven-part structure of the first edition, the handbook begins with a review of introductory material followed by a discussion of well-known classes of data structures: Priority Queues, Dictionary Structures, and Multidimensional structures. The editors next analyze miscellaneous data structures which are well-known structures that elude easy classification. The book then addresses mechanisms and tools that were developed to facilitate the use of data structures in real programs. It concludes with an examination of the applications of data structures. Four new chapters have been added on Bloom Filters, Binary Decision Diagrams, Data Structures for Cheminformatics, and Data Structures for Big Data Stores, and updates have been made to other chapters that appeared in the first edition. The Handbook is invaluable for suggesting new ideas for research in data structures and for revealing application contexts in which they can be deployed. Practitioners devising algorithms will gain insight into organizing data allowing them to solve algorithmic problems more efficiently.

Proceedings of Fourth International Conference on Soft Computing for Problem Solving Kedar Nath Das, Kusum Deep, Millie Pant, Jagdish Chand Bansal, Atulya Nagar, 2014-12-24 The Proceedings of SocProS 2014 serves as an academic bonanza for scientists and researchers working in the field of Soft Computing. This book contains theoretical as well as practical aspects using fuzzy logic, neural networks, evolutionary algorithms, swarm intelligence algorithms, etc. with many applications under the umbrella of Soft Computing. The book is beneficial for young as

well as experienced researchers dealing across complex and intricate real world problems for which finding a solution by traditional methods is a difficult task The different application areas covered in the Proceedings are Image Processing Cryptanalysis Industrial Optimization Supply Chain Management Newly Proposed Nature Inspired Algorithms Signal Processing Problems related to Medical and Healthcare Networking Optimization Problems etc Algorithmics for Hard Problems Juraj Hromkovič, 2013-03-14 Algorithmic design especially for hard problems is more essential for success in solving them than any standard improvement of current computer technologies Because of this the design of algorithms for solving hard problems is the core of current algorithmic research from the theoretical point of view as well as from the practical point of view There are many general textbooks on algorithmics and several specialized books devoted to particular approaches such as local search randomization approximation algorithms or heuristics But there is no textbook that focuses on the design of algorithms for hard computing tasks and that systematically explains combines and compares the main possibilities for attacking hard algorithmic problems As this topic is fundamental for computer science this book tries to close this gap Another motivation and probably the main reason for writing this book is connected to education The considered area has developed very dynamically in recent years and the research on this topic discovered several profound results new concepts and new methods Some of the achieved contributions are so fundamental that one can speak about paradigms which should be included in the education of every computer science student Unfortunately this is very far from reality This is because these paradigms are not sufficiently known in the computer science community and so they are insufficiently communicated to students and practitioners **Combinatorial Optimization** Bernhard Korte, Jens Vygen, 2006-01-27 This well written textbook on combinatorial optimization puts special emphasis on theoretical results and algorithms with provably good performance in contrast to heuristics The book contains complete but concise proofs as well as many deep results some of which have not appeared in any previous books **Adaptive and Natural Computing Algorithms** Bernadete Ribeiro, Rudolf F. Albrecht, Andrej Dobnikar, David W. Pearson, Nigel C. Steele, 2005-12-12 The ICANNGA series of Conferences has been organised since 1993 and has a long history of promoting the principles and understanding of computational intelligence paradigms within the scientific community and is a reference for established workers in this area Starting in Innsbruck in Austria 1993 then to Ales in France 1995 Norwich in England 1997 Portoroz in Slovenia 1999 Prague in the Czech Republic 2001 and finally Roanne in France 2003 the ICANNGA series has established itself for experienced workers in the field The series has also been of value to young researchers wishing both to extend their knowledge and experience and also to meet internationally renowned experts The 2005 Conference the seventh in the ICANNGA series will take place at the University of Coimbra in Portugal drawing on the experience of previous events and following the same general model combining technical sessions including plenary lectures by renowned scientists with tutorials **Advances in Computers**, 1989-07-17 Advances in Computers Spatial Context Christopher Gold, 2018-04-17 Many disciplines are

concerned with manipulating geometric or spatial objects in the computer such as geology cartography computer aided design CAD etc and each of these have developed their own data structures and techniques often independently Nevertheless in many cases the object types and the spatial queries are similar and this book attempts to find a common theme
