Introduction

We can say that a dam is a barrier across the width of a river or stream that can usually change the characteristics of the flow and that usually leads to a change in the level of the height of the water. Many types of dams are designed to be applied in natural canals and laboratories. Dikes can be shaped with broad or short tops and sharp tops, often referred to as flumes, from thin sheets with sharp edges. We can derive the relationship between flow rate and water depth over the dam, using Bernoulli's equation and by making some assumptions regarding the pressure distribution and head loss of the flow passing over the
