

Process	Diagram	Notes
The Water Cycle		
Evaporation	Condensation	Precipitation
Transpiration	Runoff	Infiltration
1. The sun heats the water in the oceans. Some water turns into vapor and rises into the air.	2. As the water vapor rises, it cools and turns back into tiny droplets of water. These droplets form clouds.	3. When the droplets in the clouds get big enough, they fall back to the ground as rain, snow, or hail.
4. Plants and animals also release water vapor into the air through transpiration.	5. The water vapor in the air cools and forms clouds.	6. The water in the clouds falls back to the ground as precipitation.
7. The water that falls on the ground can run off into the oceans or lakes, or it can soak into the ground and become groundwater.	8. The water that runs off into the oceans or lakes can evaporate again and start the cycle over.	9. The water that soaks into the ground can be used by plants and animals, or it can flow back into the oceans or lakes.
10. The water cycle is a continuous process that keeps the water on Earth moving.
