CHAPTER 6: CHEMICAL BONDING

The following pages contain the bulk (but not all) of the information for the chapter 6 test. Focus on this content, but make sure to review class notes, activities, handouts, questions, etc. If you study this document and NOTHING else, you should at least be able to PASS the test.
***** Test items will be recall, examples, and/or application of this content. *****

OUTCOMES

- Collaborate with peer(s) to understand chemistry content (C C)
- Communicate chemistry content to teacher and peer(s) (E C)
- 6.2: Use the Lewis dot notation, illustrate the covalent bond as the sharing of electrons (F & PK)
- 6.3: List important physical properties of ionic compounds; sum of oxidation numbers = zero (F & PK)

6.1: INTRODUCTION TO CHEMICAL BONDING

- **Vocabulary**
 - **chemical bond** – the attractive force that holds atoms or ions together
 - **ionic bonding** – a force that attracts electrons from one atom to another, which transforms a neutral atom into an ion
 - **covalent bonding** – a bond formed when atoms share one or more pairs of electrons
 - **nonpolar-covalent bond** – a covalent bond in which the bonding electrons are equally attracted to both bonded atoms
 - **polar** – describes a molecule in which the positive and negative charges are separated
 - **polar-covalent bond** – a covalent bond in which a pair of electrons shared by two atoms is held more closely by one atom
- **Chapter Highlights**
 - Most atoms are chemically bonded to other atoms. The three major types of chemical bonding are ionic, covalent, and metallic.
 - In general, atoms of metals bond ionically with atoms of nonmetals, atoms of metals bond metallically with each other, and atoms of nonmetals bond covalently with each other.

6.2: COVALENT BONDING AND MOLECULAR COMPOUNDS

- **Vocabulary**
 - **molecule** – a group of atoms that are held together by chemical forces; a molecule is the smallest unit of matter that can exist by itself and retain all of a substance's chemical properties
 - **molecular compound** – a chemical compound whose simplest units are molecules
 - **chemical formula** – a combination of chemical symbols and numbers to represent a substance
 - **molecular formula** – a chemical formula that shows the number and kinds of atoms in a molecule, but not the arrangement of the atoms
 - **electron-dot notation** – an electron configuration notation in which only the valence electrons of an atom of a particular element are shown, indicated by dots placed around the element's symbol
 - **Lewis structure** – a structural formula in which electrons are represented by dots; dot pairs or dashes between two atomic symbols represent pairs in covalent bonds.
See examples at right for LEWIS STRUCTURES of NF₃ and OCl₂
 - **structural formula** – a formula that indicates the location of the atoms, groups, or ions relative to one another in a molecule and that indicates the number and location of chemical bonds
 - **single bond** – a covalent bond in which two atoms share one pair of electrons
 - **multiple bond** – a bond in which the atoms share more than one pair of electrons, such as a double bond or a triple bond
 - **resonance** – the bonding in molecules or ions that cannot be correctly represented by a single Lewis structure
- **Chapter Highlights**
 - Atoms in molecules are joined by covalent bonds. In a covalent bond, two atoms share one or more pairs of electrons.

Foundations of Inorganic Chemistry by Gary Wulfsberg is our newest entry into the field of Inorganic Chemistry textbooks designed uniquely for a one semester stand alone course or to be used in a full year inorganic sequence. Foundations of Inorganic Chemistry by Gary Wulfsberg is our newest entry into the field of Inorganic Chemistry textbooks designed uniquely for a one semester stand alone course or to be used in a full year inorganic sequence. By covering virtually every topic in the test from the 2016 ACS Exams Institute, this book will prepare your students for success. The new book combines careful pedagogy, clear writing, beautifully rendered two color art, and solved examples with a broad array of original chapter ending exercises. It assumes a background in General Chemistry but reviews key concepts and also assumes enrollment in a Foundations of Organic Chemistry course. Symmetry and molecular orbital theory are introduced after the student has developed an understanding of fundamental trends in chemical properties and reactions across the periodic table which allows MO theory to be more broadly applied in subsequent chapters. Use of this text is expected to increase student enrollment and build students' appreciation of the central role of inorganic chemistry in any allied field. Key Features: Over 900 end of chapter exercises, half answered in the back of the book; Over 180 worked examples; Optional experiments/demos; Clearly cited connections to other areas in chemistry and chemical sciences; Chapter opening biographical vignettes of noted scientists in Inorganic Chemistry; Optional General Chemistry review sections. Originally rendered in two color illustrations throughout.

Laboratory Experiments to Accompany "Modern Chemistry," Fredus Nelson Peters, 1902 **Lab Experiments Modern Chemistry** Harold Clark Metcalfe, 1982 Modern Methods of Drug Discovery Alexander Hillisch, Rolf Hilgenfeld, 2012-11-28 Research in the pharmaceutical industry today is in many respects quite different from what it used to be only fifteen years ago There have been dramatic changes in approaches for identifying new chemical entities with a desired biological activity While chemical modification of existing leads was the most important approach in the 1970s and 1980s high throughput screening and structure based design are now major players among a multitude of methods used in drug discovery Quite often companies favor one of these relatively new approaches over the other e.g screening over rational design or vice versa but we believe that an intelligent and concerted use of several or all methods currently available to drug discovery will be more successful in the medium term What has changed most significantly in the past few years is

the time available for identifying new chemical entities Because of the high costs of drug discovery projects pressure for maximum success in the shortest possible time is higher than ever In addition the multidisciplinary character of the field is much more pronounced today than it used to be As a consequence researchers and project managers in the pharmaceutical industry should have a solid knowledge of the more important methods available to drug discovery because it is the rapidly and intelligently combined use of these which will determine the success or failure of preclinical projects
