Lift Section (See FIGURE 3.)

When the spool is moved to the Lift position, the spool makes a restriction in the open center passage. The increased pressure in the parallel passage causes oil to flow through the check valve to the supply cavity. The oil flows from the supply cavity through a section of the spool to the lift cylinder.

When the spool is in the Lower position, the spool opens a path from the lift cylinder to the drain cavity. The spool is made so that the oil flow through the open center passage is not stopped.

Tilt Section

The basic operation of the tilt spool is the same as the other spools in this control valve. The tilt control spool turns inside the tilt spool adds an additional response to the tilt forward function.

TIPT BACKWARD (See FIGURE 4.)

When the spool is moved to the Back tilt position, the tilt spool causes a restriction of the oil flow through the open center passage. The increased pressure in the parallel passage causes the oil to flow through the check valve to the supply cavity. The oil flows from the supply cavity through a section of the spool to the rod side of the tilt cylinder. The check valve prevents the movement
