What is virtual machining Virtual machining is the use of simulation based technology in particular computer aided manufacturing CAM software to aid engineers in defining simulating and visualizing machining operations for parts or assembly in a computer or virtual environment By using virtual machining the machining process can be defined and verified early in the product design stage Some if not all of the less desirable design features in the context of part manufacturing such as deep pockets holes or fillets of different sizes or cutting on multiple sides can be detected and addressed while the product design is still being finalized In addition machining related problems such as undesirable surface finish surface gouging and tool or tool holder colliding with stock or fixtures can be identified and eliminated before mounting a stock on a CNC machine at shop floor In addition manufacturing cost which constitutes a significant portion of the product cost can be estimated using the machining time estimated in the virtual machining simulation Virtual machining allows engineers to conduct machining process planning generate machining toolpaths visualize and simulate machining operations and estimate machining time Moreover the toolpaths generated can be converted into NC codes to machine functional parts as well as die or mold for part production In most cases the toolpath is generated in a so called CL data format and then converted to G codes using respective post processors
