

Respiration Article & Follow-Up Questions

CELLULAR RESPIRATION

All living things need energy to survive and carry out life processes. Whether an organism makes its own food through photosynthesis or eats another organism for food, all organisms* use the same process to turn their food into usable energy. This process is called *cellular respiration*.

Mitochondrion

Cellular respiration is a chemical reaction that happens in an organelle called the *mitochondrion* (plural: mitochondria). Mitochondria are found in the cells of nearly every organism on Earth. While almost all cells in the human body contain mitochondria, cells that require a lot of energy, such as muscle cells, can contain hundreds or thousands of them.

All organisms need a source of food. In the cellular respiration, plants are performing photosynthesis. Glucose is the main source of energy for cells. Plants use carbon dioxide and water to make glucose. Animals use glucose for energy. They breathe in oxygen and breathe out carbon dioxide. The process of cellular respiration is a cycle. It starts with glucose and oxygen, and it ends with carbon dioxide and water. The cycle is completed when the products of one reaction become the reactants of another.

Cellular respiration is a complex process that occurs in several stages. The first stage is glycolysis, which occurs in the cytoplasm. It breaks down glucose into two molecules of pyruvate. The second stage is the Krebs cycle, which occurs in the mitochondria. It releases carbon dioxide and produces energy in the form of ATP (adenosine triphosphate). The third stage is the electron transport chain, which also occurs in the mitochondria. It produces more ATP and releases water. At the end of the process, the cell has harvested energy from the glucose. Carbon dioxide and water are produced as waste products. Carbon dioxide is released into the air, and water is used for various cellular processes. In general, animals breathe out the waste products carbon dioxide and water (as water vapor) when they exhale. Plants use the carbon dioxide and water to perform photosynthesis to make more glucose for an energy source. Excess water may leave the plant stomata in a process called transpiration.

*There are some exceptions to this. Some organisms in extreme environments use a different process to produce energy.
