Mfs Desalination Process:

Current Trends and Future Developments on (Bio-) Membranes Angelo Basile, Evangelos P. Favvas, 2023-11-21
Modern Approaches in Membrane Technology for Gas Separation and Water Treatment presents condensed information on novel and promising membrane materials. The book answers some major questions from the membrane community about three promising materials that are to be introduced at industrial scale. It introduces recent out of the box ideas concerning the application of new methods capable to enhance the membrane separation efficiency. Sections cover potential commercialization, important question on three famous membrane materials and new approaches in membrane technology. Finally, the book describes and discusses three novel ideas about the potential effect of the magnetic field on membrane separation efficiency, the use of cryogenic technology on membrane separations and the use of nanobubble technology on water membrane processes. Focuses on the necessity for environmental friendly and cost effective purification and separation process. Lists all new membrane materials suitable for commercialization. Presents new modern approaches and ideas for improving the membrane efficiency. **Government-wide Index to Federal Research & Development Reports**, 1967

NASA Tech Briefs, 1983 **U.S. Government Research & Development Reports**, 1970 **Advanced Computational Approaches for Water Treatment** Krunal M Gangawane, Madhuresh Dwivedi, Praveen Ghodke, 2023-10-06
A rapid growth in global industrialization and population has triggered intense environmental pollution that has led to a water crisis resulting in the decay in the quality of human life and economic losses. Novel water purification techniques are expected to alleviate this challenge. Recently various water purification techniques along with different computational techniques have been developed. For instance water purification techniques such as electromagnetic water purification, solute surface interactions in water, use of micro magnetofluidic devices, UV led water purification and use of membranes can be thoroughly investigated by using a range of computation techniques such as molecular dynamics, the lattice Boltzmann method and the Navier Stokes method based solver. **Advanced Computational Approaches for Water Treatment Applications in Food and Chemical Engineering** presents these different numerical techniques and traditional modeling and simulation approaches to elaborate on and explain the various water purification techniques. Features Serves as a dedicated reference for this emerging topic. Discusses state of the art developments in advanced computational techniques for water purification. Brings together diverse experience in this field in one reference text. Provides a roadmap for future developments in the area. This book is primarily intended for chemical engineers, hydrologists, water resource managers, civil engineers, environmental engineers, food scientists and food engineers interested in understanding the numerical approaches for different water purification techniques such as membrane, sedimentation, filtration, micromagnetofluidic device and ozone UV among others.

Assessing Bacterial Growth Potential in Seawater Reverse Osmosis Pretreatment Almotasembellah

Abushaban,2019-12-09 Seawater desalination is increasingly being used as a means to augment freshwater supplies in regions with high water stress and reverse osmosis is increasingly the technology of choice because of the low energy consumption However seawater reverse osmosis SWRO systems suffer from various types of fouling which can increase energy consumption and the use of chemicals during SWRO operation In practice pre treatment systems are put in place to reduce the particulate and biological fouling potential of SWRO feed water However simple reliable and accurate methods to assess the extent to which biological fouling potential is reduced during pre treatment are not available for seawater This research developed a new method to measure bacterial growth potential BGP using the native bacterial consortium in seawater New reagents to extract and detect ATP in microbial cells were specifically developed for seawater The new lysis and detection reagents overcame the salt interference in seawater and allow low detection of total ATP free ATP and microbial ATP in seawater Incorporating a filtration step further increased the sensitivity of the method six fold enabling ATP detection of ultra low levels of microbial ATP in seawater The newly developed ATP based BGP method was applied to monitor and assess the pre treatment of five full scale seawater desalination plants around the world A good correlation was observed between BGP measured in SWRO feed water and the pressure drop increase in the SWRO systems suggesting the applicability of using the ATP based BGP method as a biofouling indicator in SWRO Furthermore a safe level of BGP In the future on line monitoring of BGP in SWRO feed water may further reduce the consumption of chemicals and energy and improve the overall sustainability of seawater desalination by reverse osmosis
