Sachs,2013-03-09 There exist essentially two levels of investigation in theoretical physics One is primarily descriptive concentrating as it does on useful phenomenological approaches toward the most economical classifications of large classes of experimental data on particular phenomena The other whose thrust is explanatory has as its aim the formulation of those underlying hypotheses and their mathematical representations that are capable of furnishing via deductive analysis predictions constituting the particulars of universals the asserted laws about the phenomena under consideration The two principal disciplines of contemporary theoretical physics quantum theory and the theory of relativity fall basically into these respective categories General Relativity and Matter represents a bold attempt by its author to formulate in as transparent and complete a way as possible a fundamental theory of matter rooted in the theory of relativity where the latter is viewed as providing an explanatory level of understanding for probing the fundamental nature of matter in domains ranging all the way from fermis and less to light years and more We hasten to add that this assertion is not meant to imply that the author pretends with his theory to encompass all of physics or even a tiny part of the complete objective understanding of our accessible universe But he does adopt the philosophy that underlying all natural phenomena there is a common conceptual basis and then proceeds to investigate how far such a unified view can take us at its present stage of development

Commutative Harmonic Analysis III V.P. Havin, N.K. Nikol'skij, 2012-12-06 The theory of generalized functions is a general method that makes it possible to consider and compute divergent integrals sum divergent series differentiate discontinuous functions perform the operation of integration to any complex power and carry out other such operations that are impossible in classical analysis Such operations are widely used in mathematical physics and the theory of differential equations where the ideas of generalized functions first arose in other areas of analysis and beyond The point of departure for this theory is to regard a function not as a mapping of point sets but as a linear functional defined on smooth densities This route leads to the loss of the concept of the value of function at a point and also the possibility of multiplying functions but it makes it possible to perform differentiation an unlimited number of times The space of generalized functions of finite order is the minimal extension of the space of continuous functions in which coordinate differentiations are defined everywhere In this sense the theory of generalized functions is a development of all of classical analysis in particular harmonic analysis and is to some extent the perfection of it The more general theories of ultradistributions or generalized functions of infinite order make it possible to consider infinite series of generalized derivatives of continuous functions

 Alexander Koldobsky, 2005 The study of the geometry of convex bodies based on information about sections and projections of these bodies has important applications in many areas of mathematics and science In this book a new Fourier analysis approach is discussed The idea is to express certain geometric properties of bodies in terms of Fourier analysis and to use harmonic analysis methods to solve geometric problems One of the results discussed in the book is Ball's theorem establishing the exact upper bound for the  $n-1$  dimensional volume of hyperplane sections of the  $n$  dimensional unit cube it is  $\sqrt{2}$  for each  $n \geq 2$  Another is the Busemann Petty problem if  $K$  and  $L$  are two convex origin symmetric  $n$  dimensional bodies and the  $n-1$  dimensional volume of each central hyperplane section of  $K$  is less than the  $n-1$  dimensional volume of the corresponding section of  $L$  is it true that the  $n$  dimensional volume of  $K$  is less than the volume of  $L$  The answer is positive for  $n \leq 4$  and negative for  $n \geq 4$  The book is suitable for all mathematicians interested in geometry harmonic and functional analysis and probability Prerequisites for reading this book include basic real complex and functional analysis
