Energy and Seismic Renovation Strategies for Sustainable Cities Giuseppe Margani, 2019-06-11 The principle of sustainability should be strictly connected with safety since both aim to

conserve resources in the case of sustainability the resources are typically thought of as environmental while in the case of safety the resources are basically human In spite of this common ground discussions on sustainability usually give insufficient attention to safety In the last years the EU has made large investments to increase the energy efficiency of the existing building stock paving the way for a low carbon future however less effort has been made to enhance its seismic resilience Therefore the safety and consequently the sustainability of towns situated in earthquake prone countries remain inadequate In such countries energy renovation actions should be combined with seismic retrofitting However a number of barriers considerably limit the real possibility of extensively undertaking combined retrofit actions especially for multi owner housing and high rise buildings These barriers are of different kinds technical e g unfeasibility and or ineffectiveness of conventional retrofit solutions financial e g high renovation costs insufficient incentives subsidies organizational e g occupants disruption and relocation renovation consensus by condominium ownerships and cultural social insufficient information and skills lack of adequate policy measures for promoting renovation actions This book aims to overcome these barriers and to bridge the gap between sustainability and safety so to conserve both human and environmental resources
