

DIVIDING FRACTIONS

Dividing a Fraction by a Whole Number

Just like with dividing whole numbers, dividing fractions is breaking up one number into parts of equal size.

There are two strategies to divide a whole number by a fraction:

Model: $\frac{2}{5} \div 4$

1. Draw fraction bars to model the fraction. Make sure to shade in the parts you have.

2. Break each part (even the unshaded ones) into smaller pieces based on the divisor. For example, here the divisor is 4 so each part of the whole, again even the unshaded ones, will be split into 4 parts.

3. Count the total number of smaller parts in the whole, this is your denominator
20

4. Outline the two shaded parts from your original model.

5. Circle ONE smaller part in each of the smaller parts. Count them, this will be your numerator.

Answer: $\frac{2}{20}$

Multiply by the Reciprocal:

1. Write the equation.

$$\frac{2}{5} \div 4$$

2. In this strategy we are in fact going to multiply BUT we need to flip the divisor first.

A fraction's **reciprocal** is when it is flipped upside down. The numerator ends up on the bottom, and denominator ends up on top.

Keep in mind that the whole number doesn't look like a fraction, but if it was a fraction it would have a denominator of 1.

$$\frac{2}{5} \div \frac{1}{4}$$

3. After, and only after, you have flipped the divisor to its reciprocal you will change the division to multiplication, then solve!

$$\frac{2}{5} \times \frac{1}{4}$$

Answer: $\frac{2}{20}$
