Semi-empirical Neural Network Modeling and Digital Twins Development Dmitriy Tarkhov,Alexander Nikolayevich Vasilyev,2019-11-23 Semi empirical Neural Network Modeling presents a new approach on how to quickly construct an accurate multilayered neural network solution of differential equations Current neural network methods have significant disadvantages including a lengthy learning process and single layered neural networks built on the finite element method FEM The strength of the new method presented in this book is the automatic inclusion of task parameters in the final solution formula which eliminates the need for repeated problem solving This is especially important for constructing individual models with unique features The book illustrates key concepts through a large number of specific problems both hypothetical models and practical interest Offers a new approach to neural networks using a unified simulation model at all stages of design and operation Illustrates this new approach with numerous concrete examples throughout the book Presents the methodology in separate and clearly defined stages

Partial Differential Equations D. Sloan,S. Vandewalle,E. Süli,2012-12-02 homepage sac cam na2000 index.html7 Volume Set now available at special set price Over the second half of the 20th century the subject area loosely referred to as numerical analysis of partial differential equations PDEs has undergone unprecedented development At its practical end the vigorous growth and steady diversification of the field were stimulated by the demand for accurate and reliable tools for computational modelling in physical sciences and engineering and by the rapid development of computer hardware and architecture At the more theoretical end the analytical insight into the underlying stability and accuracy properties of computational algorithms for PDEs was deepened by building upon recent progress in mathematical analysis and in the theory of PDEs To embark on a comprehensive review of the field of numerical analysis of partial differential equations within a single volume of this journal would have been an impossible task Indeed the 16 contributions included here by some of the foremost world authorities in the subject represent only a small sample of the major developments We hope that these articles will nevertheless provide the reader with a stimulating glimpse into this diverse exciting and important field The opening paper by Thom e reviews the history of numerical analysis of PDEs starting with the 1928 paper by Courant Friedrichs and Lewy on the solution of problems of mathematical physics by means of finite differences This excellent survey takes the reader through the development of finite differences for elliptic problems from the 1930s and the intense study of

finite differences for general initial value problems during the 1950s and 1960s The formulation of the concept of stability is explored in the Lax equivalence theorem and the Kreiss matrix lemmas Reference is made to the introduction of the finite element method by structural engineers and a description is given of the subsequent development and mathematical analysis of the finite element method with piecewise polynomial approximating functions The penultimate section of Thomas's survey deals with other classes of approximation methods and this covers methods such as collocation methods spectral methods finite volume methods and boundary integral methods The final section is devoted to numerical linear algebra for elliptic problems The next three papers by Bialecki and Fairweather Hesthaven and Gottlieb and Dahmen describe respectively spline collocation methods spectral methods and wavelet methods The work by Bialecki and Fairweather is a comprehensive overview of orthogonal spline collocation from its first appearance to the latest mathematical developments and applications The emphasis throughout is on problems in two space dimensions The paper by Hesthaven and Gottlieb presents a review of Fourier and Chebyshev pseudospectral methods for the solution of hyperbolic PDEs Particular emphasis is placed on the treatment of boundaries stability of time discretisations treatment of non smooth solutions and multidomain techniques The paper gives a clear view of the advances that have been made over the last decade in solving hyperbolic problems by means of spectral methods but it shows that many critical issues remain open The paper by Dahmen reviews the recent rapid growth in the use of wavelet methods for PDEs The author focuses on the use of adaptivity where significant successes have recently been achieved He describes the potential weaknesses of wavelet methods as well as the perceived strengths thus giving a balanced view that should encourage the study of wavelet methods
