Revolutionizing Collaboration through e-Work, e-Business, and e-Service Shimon Y. Nof, Jose Ceroni, Wootae Jeong, Mohsen Moghaddam, 2015-06-10 Collaboration in highly distributed organizations of people robots and autonomous systems is and must be revolutionized by engineering augmentation The aim is to augment humans abilities at work and through this augmentation improve organizations abilities to accomplish their missions This book establishes the theoretical foundations and design principles of collaborative e Work e Business and e Service their models and applications design and implementation techniques The fundamental premise is that without effective e Work and e Services the potential of emerging activities such as e Commerce virtual manufacturing tele robotic medicine automated construction smart energy grid cyber supported agriculture and intelligent transportation cannot be fully materialized Typically workers and managers of such value networks are frustrated with complex information systems originally designed and built to simplify and improve performance Even if the human computer interface for such systems is well designed the information and task overloads can be overwhelming Effective delivery of expected outcomes may not occur Challenges and emerging solutions in the context of the recently developed CCT Collaborative Control Theory are described with emphasis on issues of computer supported and communication enabled integration coordination and augmented collaboration Research results and analyses of engineering design methods and complex systems management techniques are explained and illustrated Advances in human-robot collaboration in agricultural robotics Dr George Adamides, Professor Yael Edan, 2024-03-25 Introduction of robotics into agriculture has the potential to lower production costs reduce the drudgery of tedious manual labor increase the level of accuracy of mechanized operations and improve environmental control Unlike industrial applications that often deal with relatively simple repetitive well defined and known a priori tasks agriculture robots usually require advanced technologies to deal with the relatively more complex and highly unstructured and dynamic nature of both biological produce and the environment This chapter reviews agricultural robotic systems with a focus on recent advances in human robot collaboration

Wind Farm Gastón Orlando Suvire, 2011-07-28 During the last two decades increase in electricity demand and environmental concern resulted in fast growth of power production from renewable sources Wind power is one of the most efficient alternatives Due to rapid development of wind turbine technology and increasing size of wind farms wind power plays a significant part in the power production in some countries However fundamental differences exist between conventional thermal hydro and nuclear generation and wind power such as different generation systems and the difficulty in controlling the primary movement of a wind turbine due to the wind and its random fluctuations These differences are reflected in the specific interaction of wind turbines with the power system This book addresses a wide variety of issues regarding the integration of wind farms in power systems The book contains 14 chapters divided into three parts The first part outlines aspects related to the impact of the wind power generation on the electric system In the second part

alternatives to mitigate problems of the wind farm integration are presented Finally the third part covers issues of modeling and simulation of wind power system

Multimodal Transport Systems Slim Hammadi, Mekki Ksouri, 2013-12-11 The use and management of multimodal transport systems including car pooling and goods transportation have become extremely complex due to their large size sometimes several thousand variables the nature of their dynamic relationships as well as the many constraints to which they are subjected The managers of these systems must ensure that the system works as efficiently as possible by managing the various causes of malfunction of the transport system vehicle breakdowns road obstructions accidents etc The detection and resolution of conflicts which are particularly complex and must be dealt with in real time are currently processed manually by operators However the experience and abilities of these operators are no longer sufficient when faced with the complexity of the problems to be solved It is thus necessary to provide them with an interactive tool to help with the management of disturbances enabling them to identify the different disturbances to characterize and prioritize these disturbances to process them by taking into account their specifics and to evaluate the impact of the decisions in real time Each chapter of this book can be broken down into an approach for solving a transport problem in 3 stages i e modeling the problem creating optimization algorithms and validating the solutions The management of a transport system calls for knowledge of a variety of theories problem modeling tools multi objective problem classification optimization algorithms etc The different constraints increase its complexity drastically and thus require a model that represents as far as possible all the components of a problem in order to better identify it and propose corresponding solutions These solutions are then evaluated according to the criteria of the transport providers as well as those of the city transport authorities This book consists of a state of the art on innovative transport systems as well as the possibility of coordinating with the current public transport system and the authors clearly illustrate this coordination within the framework of an intelligent transport system
