From Photon to Pixel Henri Maitre, 2017-02-08 This second edition of the fully revised and updated From Photon to Pixel presents essential elements in modern digital photographic devices Our universal infatuation with photography profoundly affects its usage and development While some sides of photographic culture remain wholly unchanged art photography journalistic and advertising photography scientific photography etc new facets emerge leisure or travel photography everyday life photography anecdotal observational or unusual photography and microcosm or micro community photography with its culmination in the narcissistic selfie These new forms combine an often simplified manner of photographing and modern means of instantaneous remote and mass communication This book does not extend into the sociological study of photography instead it explains how the digital camera works by examining in detail each of the components that constitutes it to provide the reader with a preliminary guide into the inner workings of this device

SOME INVESTIGATIONS ON STEGANOGRAPHY TECHNIQUES Dr. V. Nagaraj, 2021-05-20 Steganography is the art of hiding and transmitting data through apparently innocuous carriers in an effort to conceal the existence of the secret data The Least Significant Bit LSB steganography that replaces the least significant bits of the host medium is a widely used technique with low computational complexity and high insertion capacity Although it has good perceptual transparency it is vulnerable to steganalysis which is based on statistical analysis Many other steganography algorithms have been developed such as Discrete Cosine Transform DCT Discrete Wavelet Transform DWT and Spread Spectrum Embedding But the insertion capacities for all the above methods were not satisfied Therefore developing new steganography algorithms against statistical analysis seems to be the prime requirement in steganography The LSB insertion method is the most common and easiest method for embedding messages in an image with high capacity However it is detectable by statistical analysis such as RS and Chisquare analysis Hence researchers are still in look out for steganography techniques with enhanced insertion capacity of secret data along with greater security and which can resist attacks In this work in order to enhance the embedding capacity of secret data four techniques for secret communication have been proposed They are classified into two categories In first category cryptography is used along with steganography to enhance the security while in second category only steganography is used In the first category two improved LSB substitution techniques have been proposed The first technique is known as Zigzag

Modulo Substitution Method in which embedding locations are Sequence based The second technique is known as Random Modulo Substitution Method using Random Technique in LSB Steganography and user key based LSB substitution steganography for RGB images where in RSA algorithm is used for encryption The techniques under the first category are exclusively LSB array based The first LSB array based technique embeds message bits into LSB arrays of cover image by using zigzag scanning On the other hand the Random Modulo Substitution Method embeds secret data into the different locations of cover image by using pseudo random index generator Moreover both these LSB array based techniques use RSA algorithm to enhance security Histogram and Statistical analysis performed on the stego image proved that the proposed techniques can effectively resist steganalysis Comparison of the statistical parameters like Root Mean Square RMS Peak Signal to Noise Ratio PSNR and Structural Similarity Index Matrix SSIM for the proposed techniques with cover image and stego image was carried out and analyzed The Second category includes pixel value modification method and pixel value differencing method in which the embedding decision for a target pixel is taken by random technique Data hiding by using pixel value modification with modulus function in color images guarantees that no pixel value will exceed the range 0 to 255 in stego image In the existing PVD embedding methods only one secret digit was embedded for two consecutive pixels but the proposed method embeds one secret digit in only one pixel Proposed method on color images gives more capacity and security than the PVD methods It also provides better visual quality of stego image Moreover proposed method extracts the hidden secret message efficiently without using the range tables In existing steganography algorithms like Pixel Value Differencing PVD methods the secret data are embedded into the differences of adjacent pixels This pair wise modification mechanism in cover image increases the histogram distortion

Real-Time Rendering, Fourth Edition Tomas Akenine-Möller, Eric Haines, Naty Hoffman, 2018-08-06 Thoroughly updated this fourth edition focuses on modern techniques used to generate synthetic three dimensional images in a fraction of a second With the advent of programmable shaders a wide variety of new algorithms have arisen and evolved over the past few years This edition discusses current practical rendering methods used in games and other applications It also presents a solid theoretical framework and relevant mathematics for the field of interactive computer graphics all in an approachable style New to this edition new chapter on VR and AR as well as expanded coverage of Visual Appearance Advanced Shading Global Illumination and Curves and Curved Surfaces **Full**
