Embrittlement of Engineering Alloys C. L. Briant, 2013-10-22 Treatise on Materials Science and Technology Volume 25 Embrittlement of Engineering Alloys is an 11 chapter text that describes some situations that produce premature failure of several engineering alloys including steels and nickel and aluminum base alloys Chapters 1 to 3 consider situations where improper alloy composition processing and or heat treatment can lead to a degradation of mechanical properties even in the absence of an aggressive environment or an elevated temperature Chapters 4 and 5 examine the effect of elevated temperatures on the mechanical properties of both ferrous and nonferrous alloys Chapters 6 and 7 discuss the effects of corrosive environments on both stressed and unstressed materials In these environments anodic dissolution is the primary step that leads to failure Chapters 8 to 10 deal with the effects of aggressive environments that lead to enhanced decohesion or embrittlement of the metal such as hydrogen liquid metal and irradiation induced embrittlement Chapter 11 looks into the embrittlement phenomena occurring during welding one of the most common processing conditions to which a material could be subjected This book will prove useful to materials scientists and researchers
