L'eau ressortit de multiples disciplines climatologie hydrologie glaciologie géomorphologie biogéographie aussi son étude est elle rarement menée pour elle-même. L'ouvrage de Jean Pierre Vigneau se veut une géographie physique de l'eau. Il est donc conçu comme un parcours transversal organisé selon le continuum du cycle. L'angle choisi est celui du mouvement. L'analyse porte sur les échanges entre les grands réservoirs de la planète et sur les transferts au sein de trois d'entre eux. Ainsi l'eau n'est ni reléguée au rang d'élément ni réduite à un rôle d'agent elle est remise sa place d'acteur déterminant du fonctionnement naturel de thème central de la géographie

Modélisation de l'hydrologie continentale et influences de l'irrigation sur le cycle de l'eau Matthieu Guimberteau, 2010

La ressource en eau et son exploitation furent la base du fondement des grandes civilisations humaines et restent vitales dans le fonctionnement de nos sociétés actuelles. L'évolution consécutive de la croissance démographique sur Terre et la concentration géographique de la demande en nourriture par les populations posent de nombreuses questions quant à la pérennité de l'eau douce présente pour l'agriculture. En effet celle-ci est en moyenne globale la première consommatrice en eau devant les prélèvements industriels et municipaux. De plus dans un contexte de changement climatique les interrogations sont nombreuses face aux devenir des pr

cipitations continentales qui sont cruciales pour l'agriculture d'autant plus dans certaines régions d'extrême exposition la sensibilité. Aussi l'irrigation tente-t-elle justement de pallier le déficit hydrique des cultures en période sèche mais implique en contrepartie des prélèvements en eau non négligeables dans les fleuves ou les nappes. Il est donc légitime de se poser la question en quoi l'irrigation peut-elle avoir un impact sur les bilans d'eau continentaux. L'irrigation représente-elle un élément perturbateur inhibiteur ou favorisant dans le cycle de l'eau ? Quels peuvent être les effets de cette action anthropique sur le climat notamment au niveau des grands pôles d'irrigation que sont le bassin du Mississippi, l'Inde ou encore la Chine ? La modélisation climatique nous a permis d'apporter quelques éléments de réponse quant à l'effet de l'irrigation sur les bilans d'eau. Tout d'abord nous avons testé la capacité du modèle de surface SECHIBA à simuler les deux composantes majeures du cycle de l'eau susceptibles d'être impactées par l'irrigation : l'humidité des sols et le débit des rivières. Pour cela nous avons utilisé un jeu de données atmosphériques haute résolution sur les États-Unis pour forcer notre modèle. Une étude de sensibilité des paramètres de végétation du modèle sur l'humidité des sols a notamment permis de montrer l'effet majeur de l'extraction de l'eau par les racines simulée par SECHIBA. De plus la comparaison avec des observations de terrain en Illinois a montré la bonne représentation des variations saisonnières de l'humidité des sols sur trois ans. La seconde étude a porté en détail sur le fonctionnement du module de routage de l'eau via les fleuves vers l'océan dans le modèle SECHIBA. Nous avons montré la nécessité du changement du pas de temps de routage lorsque l'on force le modèle haute résolution sur le bassin du Mississippi et sur ses sous-bassins. Enfin un calcul réaliste de la demande en irrigation simulée par SECHIBA a été mis en œuvre et testé. Le couplage du modèle de surface avec le GCM LMDZ a permis la prise en compte des rétroactions s'effectuant entre la surface continentale et l'atmosphère. Les différences des résultats obtenus entre une simulation prenant en compte l'irrigation et une simulation sans ce prélèvement ont révélé un effet de l'irrigation principalement sur la vaporisation et les pluies en Inde et sur le bassin du Mississippi. L'impact de l'irrigation sur le bilan d'eau peut être différent selon les régions du globe. L'irrigation contribue significativement à l'augmentation des précipitations sur la région sèche de ce bassin alors que la région humide ne présente pas de variations dans le bilan d'eau. En revanche les résultats sur l'Inde indiquent que l'irrigation affaiblit significativement le déclenchement de la mousson via la réduction du gradient thermique terre-mer conduisant moins de pluies en t.
