Childhood Head Injury Maureen Dennis,Harvey S. Levin,2016-03-23 Childhood head injuries differ from adult head injuries in some significant respects They occur against a background of ongoing physical and cognitive development Cognitive capacities often change with time post injury But for children changes are affected by two processes of functional plasticity one concerned with recovery one with development The impact of the injury is moderated by age developmental stage In recent years there has been a new focus on the longitudinal comparison of children post injury with appropriate control groups Advances in neuropsychological assessment have permitted evaluation with reference to more developmentally suitable norms expanded definitions of outcome have broadened our understanding of consequences and neuroimaging techniques have enabled the more precise delineation of injury severity the study of structure function outcome relations and the investigation of reorganization of function This special issue offers an overview of cutting edge approaches to the analysis of childhood head injury
