

to maintain a comfortable environment inside the house. By analyzing the heat transfer and air flow, we learn what heat transfer (and air flow) is required for the house to be a comfortable place. A thermodynamic analysis will tell us the conditions needed to maintain the temperature and relative humidity, and that analysis will tell us the size of the fan required to push the air in, the conditioner and the ducts needed to distribute the cooled air throughout the house.

Perhaps we want to focus on the air conditioner itself. Figure 1.2 is a schematic of two heat exchangers, a compressor, and a valve. A thermodynamic analysis would tell us how much energy is required to maintain a desired amount of cooling. A heat transfer analysis would tell us the size of the heat exchangers. The fluid dynamics analysis would tell us the pressure drop across the compressor and the ducts, as well as the required compressor power.

FIGURE 1.3 Schematic of a building showing heat transfer.

It is a simple task, however, a cooling system with a compressor (Figure 1.3). The compressor, the condenser, the evaporator, and the expansion valve must be selected so that the refrigerant of the system is not compressed. This is a simple task, however, a cooling system with a compressor, the condenser, the evaporator, and the expansion valve must be selected so that the refrigerant of the system is not compressed. 1.2 THERMAL AND FLUID SYSTEMS ANALYSIS AND ENGINEERING

Additional disciplines, similar to those given in the previous section, can be given for many different systems (e.g., power plants, air conditioning, chemical processing plants) and related processes (e.g., heat treatment of metals). Heat propagation that would involve heat conduction, heat transfer, and fluid dynamics are all needed in many design fields. It is the engineer's job to know these disciplines that is required for thermal and fluid systems analysis of many systems.

Whether the engineer is given an assignment to design a new device or modification to an existing process or to predict the performance of a device, the objective of the design process must be very clear. Subsequent, which aspect of the device, process, or system is which to focus must be well defined. A systematic approach to the design process is needed. Figure 1.4 shows a flow diagram of the design process. The design process typically takes three steps and engineering a device from scratch. We always begin with the physical system (e.g., the engine of a car). This is reality. The engineer's job is, first, to describe the physical system into a physical model and, second, to describe the physical model with a mathematical model. The actual physical system may be so complex that it is impossible to fully describe each part within process. However, we require that device as a model, a picture, or picture that we can describe and represent in depth by the system sufficiently so that it can be modeled. Once a physical model is developed, then physical laws that govern the process (e.g., a force, momentum, mass, or energy balance) are used to create the
