Implantable Defibrillator Therapy: A Clinical Guide Antonio Pacifico, Philip D. Henry, Gust H. Bardy, Martin Borggrefe, Francis E. Marchlinski, Andrea Natale, Bruce L. Wilkoff, 2012-12-06 Implantable defibrillators as originally conceived by Michel Mirowski were limited to the detection and automatic termination of ventricular fibrillation In the original AID device the detection algorithm sought to distinguish sinus rhythm from ventricular fibrillation by identifying the more sinusoidal waveform of ventricular fibrillation The therapeutic intervention was elicited only once deadly polymorphic rhythms had developed It was rapidly learned however that ventricular fibrillation is usually preceded by ventricular tachycardia Mirowski recognized the pivotal importance of developing algorithms based on heart rate Ventricular tachycardia detection allowed the successful development of interventions for the termination of ventricular tachyarrhythmias before they degenerated into ventricular fibrillation Current device therapy no longer confines itself to the termination of chaotic rhythms but seeks to prevent them Diagnostic algorithms moved upward along the chain of events leading to catastrophic rhythms Rate smoothing algorithms were developed to prevent postextrasystolic pauses from triggering ventricular and atrial tachyarrhythmias Beyond the renaissance of ectopy centered strategies long term prevention received increasing attention Multisite pacing therapies provided by Arrhythmia Management Devices were designed to reduce the arrhythmia burden and optimize the synergy of cardiac contraction and relaxation Clinical evidence now suggests that atrial fibrillation prevention by pacing is feasible and that biventricular pacing may be of benefit in selected patients with heart failure However these applications of device therapy that generally require ventricular defibrillation backup remain investigational and were not considered in this book
