Tikal David L. Lentz,Nicholas P. Dunning,Vernon L. Scarborough,2015-02-23 The primary theoretical question addressed in this book focuses on the lingering concern of how the ancient Maya in the

northern Pet n Basin were able to sustain large populations in the midst of a tropical forest environment during the Late Classic period This book asks how agricultural intensification was achieved and how essential resources such as water and forest products were managed in both upland areas and seasonal wetlands or bajos All of these activities were essential components of an initially sustainable land use strategy that eventually failed to meet the demands of an escalating population This spiraling disconnect with sound ecological principles undoubtedly contributed to the Maya collapse The book's findings provide insights that broaden the understanding of the rise of social complexity the expansion of the political economy specifically and in general terms the trajectory of cultural evolution of the ancient Maya civilization **Afoot and**

Large-scale dam removal and ecosystem restoration Rebecca McCaffery,Laura Soissons,Jeffrey J. Duda,Jean-Marc Roussel,2024-09-20 Rivers are vital ecosystems that support aquatic and terrestrial biodiversity and several ecosystem services including food water culture and recreation After centuries of building dams on rivers across the world dam removal projects are now on the rise due to obsolescence reservoir sedimentation insufficient return on investment or river restoration and conservation priorities Most dam removal projects have focused on smaller structures 10 m in structural height but larger structures have also started to be removed in increasing numbers as practitioners river managers conservationists and the public have gained more experience with the practice Recent estimates suggest that only a small fraction of dam removals have been scientifically studied and include mostly small dams and short time scales Documenting the long term ecological outcomes of large dam removal i.e. 10 m tall represents a new frontier in dam removal research projects are more recent and provide an opportunity to understand the complex ecological changes that occur with these transformative restoration projects Here we aim to collate a diverse array of papers on long term dam removal research projects involving larger dams 10 m to synthesize the issues outcomes tools and experimental designs used to study large dam removal projects from physical biological and ecological perspectives With this collection we aim to showcase diverse global projects on ecosystem responses to large dam removal collect perspectives from different disciplines fields and geographies and synthesize the current state of knowledge in this area We expect that this Research Topic will be informative to ongoing long term ecological restoration and monitoring projects related to dam removal as well as to upcoming large dam removal projects We welcome contributions from all disciplines addressing the physical ecological and ecosystem responses to large scale dam removal Contributions could include original research in a specific discipline or area case studies or synthesis papers that address one or more of these topics in a transdisciplinary approach Contributors could

address any of the following major topics as related to outcomes of large dam removal alone or in combination Freshwater estuarine and marine aquatic biota River and reservoir geomorphology Terrestrial and riparian vegetation Wildlife Sedimentation and Modelling We would like contributors to highlight key results in their area of study cross disciplinary insights and lessons learned that could inform ongoing monitoring and research efforts in current projects as well as upcoming large dam removals *Ecology and Behaviour of Free-Ranging Animals Studied by Advanced Data-Logging and Tracking Techniques* Thomas Wassmer,Dennis Murray,Stan Boutin,Andreas Fahlman,Frants Havmand Jensen,2020-06-15

Establishing the Environmental Flow Regime for the Middle Zambezi River Elenestina Mwelwa-Mutekenya, 2021-07-28 The Middle Zambezi host to a rich biodiversity is located in the central part of the Zambezi River Basin which covers eight Southern African Countries The area is located downstream of three hydropower schemes In the last decades the floodplain riparian tree the *Faidherbia albida* vital for the local wild life has shown a worrying decrease in its regeneration rates This thesis explores establishing the environmental flow regime for the Middle Zambezi reach in order to minimise the impact of the upstream hydropower schemes on the river environment using the *Faidherbia albida* tree as a biological indicator The research identified that the current dam operations have completely altered the natural hydrological rhythm from pre Kariba dam dry season flows of 100 200 m³ s increasing to 1 000 1 500 m³ s The sudden closure of the dam floodgates can be linked to the observed river channel widening phenomenon In addition the *Faidherbia albida* tree now experiences longer flood residence over the floodplain making it inaccessible to animals to allow for regeneration In order to save the *F. albida* tree a two pronged environmental flow regime is proposed of releasing a moderate flood of 5 800 m³ s once in 5 years for 5 to 6 weeks in the months of February to March and phasing the spillway gates closure over a period of 3 to 4 weeks to keep the floodplain wet enough until the months of May and June Phasing of the spillway gate closure would also mitigate the excessive bank erosion
