Basic Confocal Microscopy Robert L. Price, W. Gray (Jay) Jerome, 2011-04-11 Most researchers agree that biological confocal microscopy was jump started by the confocal design first published by White and Amos in 1985 in the Journal of Cell Biology As a result this remains a relatively young field Yet the use of the technique has grown phenomenally since those early efforts with new users joining the ranks daily The publication of Basic Confocal Microscopy reflects the burgeoning need to train new students technologists and faculty wishing to use confocal microscopy in their research A direct outgrowth of the authors five day intensive course in the subject begun in 2005 this book covers the basics and includes all the information required to design implement and interpret the results of biological experiments based on confocal microscopy Concise yet comprehensive the volume begins by covering the core issues of fluorescence specimen preparation and labeling before moving on to address the analog to digital conversion of specimen data gathered using confocal microscopy Subsequent chapters detail the practicalities of operating confocal microscopes providing all the information necessary to begin practicing confocal microscopy as well as optimizing the material obtained The final block of chapters examine 3 dimensional analysis and the reconstruction of data sets outline some of the ethical considerations in confocal imaging and then supply a number of resources that the authors have found useful in their own work Once readers have mastered the information this book presents the resources found in its pages will be an excellent guide to continued learning about the more advanced forms of confocal microscopy

p53 Ayeda Ayed, Theodore Hupp, 2010-12-16. Our understanding of human cancer in the past 40 years has been driven by linking innovative concepts and cutting edge technologies to key problems identified by clinical research. Some of the successes in cancer genetics identified from clinical work have been the identification of specific gene deletions in human chromosomes, the use of PCR based cloning methodologies to identify and clone human cancer genes, the validation of the human cancer genes using transgenic technologies in the mouse and the ability to sequence whole genomes that has recently allowed a collation of all somatic and germline mutations in a human genome. In the same generation, entirely different disciplines involved in basic life science research have used model organisms like yeast, flies, worms and cancer causing animal viruses as tools to develop windows to see into the machinery of the cell life cycle. The discoveries of pro apoptotic genes, oncogenes and covalent control mechanisms like phosphorylation and ubiquitination using the tools of science and technology have all been awarded Nobel prizes for their contribution to our understanding of how cells work. The discovery of p53 using the tumor causing animal virus SV40 falls into this pioneering period of biological and medical research.

Mathematical Modeling of the Immune System in Homeostasis, Infection and Disease Gennady Bocharov,Burkhard Ludewig,Andreas Meyerhans,Vitaly Volpert,2020-02-24 The immune system provides the host organism with defense mechanisms against invading pathogens and tumor development and it plays an active role in tissue and organ regeneration Deviations from the normal physiological functioning of the immune system can lead to the development of diseases with various pathologies including autoimmune

diseases and cancer Modern research in immunology is characterized by an unprecedented level of detail that has progressed towards viewing the immune system as numerous components that function together as a whole network Currently we are facing significant difficulties in analyzing the data being generated from high throughput technologies for understanding immune system dynamics and functions a problem known as the curse of dimensionality As the mainstream research in mathematical immunology is based on low resolution models a fundamental question is how complex the mathematical models should be To respond to this challenging issue we advocate a hypothesis driven approach to formulate and apply available mathematical modelling technologies for understanding the complexity of the immune system Moreover pure empirical analyses of immune system behavior and the system's response to external perturbations can only produce a static description of the individual components of the immune system and the interactions between them Shifting our view of the immune system from a static schematic perception to a dynamic multi level system is a daunting task It requires the development of appropriate mathematical methodologies for the holistic and quantitative analysis of multi level molecular and cellular networks Their coordinated behavior is dynamically controlled via distributed feedback and feedforward mechanisms which altogether orchestrate immune system functions The molecular regulatory loops inherent to the immune system that mediate cellular behaviors e g exhaustion suppression activation and tuning can be analyzed using mathematical categories such as multi stability switches ultra sensitivity distributed system graph dynamics or hierarchical control GB is supported by the Russian Science Foundation grant 18 11 00171 AM is also supported by grants from the Spanish Ministry of Economy Industry and Competitiveness and FEDER grant no SAF2016 75505 R the Mar a de Maeztu Programme for Units of Excellence in R D MDM 2014 0370 and the Russian Science Foundation grant 18 11 00171
