Bailey, 2011-06-13 Dr Donald Bailey starts with introductory material considering the problem of embedded image processing and how some of the issues may be solved using parallel hardware solutions Field programmable gate arrays FPGAs are introduced as a technology that provides flexible fine grained hardware that can readily exploit parallelism within many image processing algorithms A brief review of FPGA programming languages provides the link between a software mindset normally associated with image processing algorithms and the hardware mindset required for efficient utilization of a parallel hardware design The design process for implementing an image

processing algorithm on an FPGA is compared with that for a conventional software implementation with the key differences highlighted. Particular attention is given to the techniques for mapping an algorithm onto an FPGA implementation considering timing, memory bandwidth and resource constraints and efficient hardware computational techniques. Extensive coverage is given of a range of low and intermediate level image processing operations, discussing efficient implementations and how these may vary according to the application. The techniques are illustrated with several example applications or case studies from projects or applications he has been involved with. Issues such as interfacing between the FPGA and peripheral devices are covered briefly as is designing the system in such a way that it can be more readily debugged and tuned. Provides a bridge between algorithms and hardware. Demonstrates how to avoid many of the potential pitfalls. Offers practical recommendations and solutions. Illustrates several real world applications and case studies. Allows those with software backgrounds to understand efficient hardware implementation. Design for Embedded Image Processing on FPGAs is ideal for researchers and engineers in the vision or image processing industry who are looking at smart sensors, machine vision and robotic vision as well as FPGA developers and application engineers. The book can also be used by graduate students studying imaging systems, computer engineering, digital design, circuit design or computer science. It can also be used as supplementary text for courses in advanced digital design, algorithm and hardware implementation and digital signal processing and applications. Understanding LTE with MATLAB Houman Zarrinkoub, 2014-01-28. An introduction to technical details related to the Physical Layer of the LTE standard with MATLAB. The LTE Long Term Evolution and LTE Advanced are among the latest mobile communications standards designed to realize the dream of a truly global, fast, all-IP based, secure broadband mobile access technology. This book examines the Physical Layer (PHY) of the LTE standards by incorporating three conceptual elements: an overview of the theory behind key enabling technologies, a concise discussion regarding standard specifications and the MATLAB algorithms needed to simulate the standard. The use of MATLAB, a widely used technical computing language, is one of the distinguishing features of this book. Through a series of MATLAB programs, the author explores each of the enabling technologies, pedagogically synthesizes an LTE PHY system model and evaluates system performance at each stage. Following this step-by-step process, readers will achieve deeper understanding of LTE concepts and specifications through simulations. Key Features: Accessible, intuitive and progressive; one of the few books to focus primarily on the modeling, simulation and implementation of the LTE PHY standard. Includes case studies and testbenches in MATLAB which build knowledge gradually and incrementally until a functional specification for the LTE PHY is attained. Accompanying Web site includes all MATLAB programs together with PowerPoint slides and other illustrative examples. Dr. Houman Zarrinkoub has served as a development manager and now as a senior product manager with MathWorks based in Massachusetts, USA. Within his 12 years at MathWorks, he has been responsible for multiple signal processing and communications software tools. Prior to

MathWorks he was a research scientist in the Wireless Group at Nortel Networks where he contributed to multiple standardization projects for 3G mobile technologies He has been awarded multiple patents on topics related to computer simulations He holds a BSc degree in Electrical Engineering from McGill University and MSc and PhD degrees in Telecommunications from the Institut Nationale de la Recherche Scientifique in Canada www.wiley.com/go/zarrinkoub

Ansätze einer High-Level-Synthese in der Electronic Design Automation Siegfried Puga-Reichle,2005-11-21 Inhaltsangabe Einleitung Die Gesellschaft wandelt sich immer mehr zu einer Informations und Kommunikationsgesellschaft Die Schlüsseltechnologie in

dieser Entwicklung stellt die Mikroelektronik dar. Die Mikroelektronik ist heute allgegenwärtig und aus unserer Gesellschaft nicht mehr weg zu denken und sie gewinnt immer noch mehr an Bedeutung in allen Lebenslagen. Im Jahre 2010 werden über 5 Milliarden Transistoren auf einem einzigen Chip integrierbar sein und die Entwicklungszyklen werden aus Wettbewerbsgründen immer kürzer. Das Entwurfsteam muss trotz der Komplexitätsexplosion dem Kosten und Zeitdruck entgegenwirken. Aufgrund dessen muss sich die Entwurfsproduktivität in jedem Jahr mehr als verdoppeln, will sie der Chipentwicklung folgen. Der ungebrochene Technologiefortschritt hat dazu geführt, dass heute ganze Systeme aus mehreren Prozessoren und komplexen Verbindungsstrukturen auf einem einzelnen Chip gefertigt werden können. SoC. Um die Komplexität dieser Systeme und mögliche Anwendungen kontrollieren zu können, bedarf es einer Automatisierung des Entwurfs auch auf höheren Entwurfsebenen. High Level Synthese. Die Automatisierung des Entwurfs. Electronic Design Automation (EDA) stellt deshalb den Schlüssel zur Mikroelektronik und damit zu den Systemen der Zukunft dar. Heutiger Standard des Schaltungsentwurfs ist die Hardwarebeschreibung durch Hardwarebeschreibungssprachen (HDL), die durch CAE-Werkzeuge (Computer Aided Engineering) zur Schaltungssimulation und -synthese benutzt werden. Dabei dient die Simulation der Überprüfung der Funktion des Entwurfs und die Synthese der Umsetzung der Beschreibung in eine Netzliste für die Implementierung der Schaltung auf die gewählte Zieltechnologie wie ASICs oder FPGAs. Als Hardwarebeschreibungssprachen haben sich weltweit die beiden Sprachen Verilog und VHDL etabliert. Die Simulation und Verifikation gewinnt zunehmend immer mehr an Bedeutung, je komplexer die Schaltungen werden. Es ist nicht mehr möglich, Signale Takt für Takt auf ihre Richtigkeit zu überprüfen, sondern es müssen neue Verifikationsstrategien gefunden werden. Einer davon ist die Entwicklung von HDVL (Sprachen Hardware Description and Verification Language). Diese Arbeit beschäftigt sich daher mit den bestehenden Problemen im Systementwurf und behandelt neue Sprachen und Werkzeuge, die eine High Level Synthese ermöglichen. Im ersten Teil soll die Problematik näher dargestellt werden und ein kleiner Background geschaffen werden.
