

Mastectomy

Mastectomy is a way of treating breast cancer by removing the entire breast through surgery. It's often done when a woman cannot be treated with breast-conserving surgery (lumpectomy) ([/cancer/breast-cancer/treatment/surgery-for-breast-cancer/breast-conserving-surgery-lumpectomy.html](https://www.cancer.org/cancer/breast-cancer/treatment/surgery-for-breast-cancer/breast-conserving-surgery-lumpectomy.html)), which spares most of the breast. It can also be done if a woman chooses mastectomy over breast-conserving surgery for personal reasons. Women at very high risk of getting a second cancer sometimes have a double mastectomy, the removal of both breasts.

Types of mastectomies

There are several different types of mastectomies, based on how the surgery is done and how much tissue is removed.

Simple (or total) mastectomy

In this procedure, the surgeon removes the entire breast, including the nipple, areola, and skin. Some underarm lymph nodes may or may not be removed depending on the situation. Most women, if they are hospitalized, can go home the next day.

Skin-sparing mastectomy

In this procedure, most of the skin over the breast is left intact. Only the breast tissue, nipple and areola are removed. The amount of breast tissue removed is the same as with a simple mastectomy. Implants or tissue from other parts of the body are used at the time of surgery to reconstruct the breast.

Many women prefer skin-sparing mastectomy because it offers the advantage of less scar tissue and a reconstructed breast that seems more natural. But it may not be suitable for larger tumors or those that are close to the surface of the skin.

The risk of local cancer recurrence with this type of mastectomy is the same as with other types of mastectomies.
