Human lung capacity is an issue much pertinent to athletes... capacity measurement is somewhat tricky. One way to do volume and/or pressure measurement within a respiratory system is spirometry. Lung capacity can also be measured using a balloon. This data provides very precise measurements and is collected using a spirometer device.

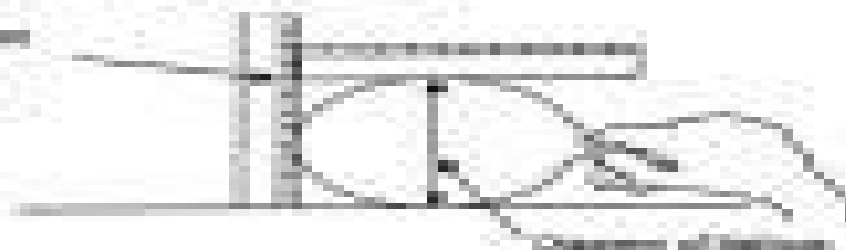

Several different lung volume measurements can be made:

1. Tidal capacity is the largest possible amount of air that can be inhaled after breathing a normal breath.
2. Expiratory reserve is the amount of air that can be inhaled in the lungs after exhaling normally (it is the portion that remains inhaled air).
3. Total volume is the amount of air that can be expelled during normal breathing.

Part A: Balloon Method

1. Measure the balloon circumference.
2. Take an average breath in (inhale). Then submerge the air into water in the balloon and push the balloon down to the bottom of the water.
3. Measure and record the diameter of the balloon in centimeters (see Data Table below). The difference between the two (before) being submerged is.

Record circumference when the height of the balloon equals the water level (with the balloon under water). This is the balloon's diameter.

4. Calculate the balloon and diameter water level. Record the diameter of the balloon in your Data Table.
5. Repeat steps 1-4 three (LAST PLACE) more times. Record diameter goes with the diameter.

Try Number	Diameter of Balloon in CM (First Trial)	Volume of Balloon Last Trial
