

LYMPH AND LYMPHATIC VESSELS

The Lymphatic System

The lymphatic system is a network of vessels that transports fluids, the cells and chemicals that travel within the vessels, and the organs and glands that produce them. The three major functions of the lymphatic system are maintaining fluid balance, lipid absorption, and body defense, as summarized in the table below.

3 Main Functions of the Lymphatic System

Fluid Balance	Fat Absorption	Defense
Absorbs excess tissue fluid to return it to the bloodstream	Absorbs lipids and fat-soluble vitamins from the digestive tract	Removes harmful substances from lymph and blood

Fluid Balance

Excess fluid in the tissues can lead to edema, a condition in which the tissues become swollen. The lymphatic system helps to maintain fluid balance by absorbing excess tissue fluid and returning it to the bloodstream.

WORKSHEET

Lymph & Lymphatic Vessels

Our first and most serious function of the lymphatic system is defense against disease. Pathogens (disease-causing organisms) are filtered from lymph by the lymph nodes and from blood by the spleen. Lymphatic organs, including the thymus and tonsils, house lymphocytes and other immune cells capable of inactivating and destroying pathogens. These immunity functions of the lymphatic system also attack foreign substances, such as toxins and cancer cells, and when this function becomes abnormal, can cause cancer, autoimmune disorders, and allergies.

Lymph

Lymph, also called lymphatic fluid, is a clear to faintly yellow fluid similar in composition to blood plasma. Lymph is derived from blood plasma as fluids pass through blood capillary walls at the arterial end. Although 90% of this fluid is reabsorbed at the venous end of the capillaries, 10% remains in the interstitial spaces. To prevent edema, the excess interstitial fluid is collected by the lymphatic capillaries and is then called lymph. Lymph is roughly 90% water. The remaining 10% is composed of white blood cells known as lymphocytes and dissolved solutes from 2 main sources. Substances in blood plasma, such as ions, nutrients, dissolved gases, and small proteins, pass from blood capillaries into the interstitial spaces to become part of the reabsorbed lymph. Substances such as hormones, enzymes, and waste products are produced by living cells within the tissues and also become part of the reabsorbed lymph.
