

INTRODUCTION

The heart is a valved, muscular pump that propel blood around the body. It is composed of muscle tissue known as the myocardium which consists of cardiac muscle. Mammals have a multichambered heart, with two atria and two ventricles. In human heart, the left atrium receives oxygenated blood from the pulmonary veins. The blood then passes through the left atrioventricular valve and enter the left ventricle. The ventricle pumps the blood through the aortic valve to the systemic aorta. When the blood passed through the entire systemic circuit, the partially deoxygenated blood enters the right atrium through the venae cavae. The blood then flows through the right atrioventricular valve to enter the right ventricle. The blood exits the heart, passing the pulmonary valve, into the pulmonary trunk, then goes to the pulmonary circuit.

Vertebrate hearts are myogenic. With this type of heart, each electrical impulse originates in the muscle cells or modified muscle cells. In almost all cases, they are innervated but still continue to beat even if all nervous connections are lost. In other animals, their hearts are neurogenic, having each contracting impulse originating in neurons.

The beating cycle of a heart, consists of a period of contraction called systole, and a period of relaxation called diastole. The contraction of every cell of the heart is associated with an action potential. The electrical activity of the heart is initiated by its pacemaker. The pacemaker is located in the sinus venosus or in a remnant called the sinoatrial node.

The mammalian heart has a conducting system composed of specialized muscle cells. This system starts with a group of cells in the right wall of the atrium known as the atrioventricular or AV node. From this node, a bundle of cells called atrioventricular bundle (common bundle or bundle of His) enters the interventricular septum. The bundle then divides
