How it works

The endocrine system works with the nervous system to control and regulate cellular activities in the body and hormones.

- Endocrine glands release hormones into the bloodstream to regulate cellular activities throughout the body.
- Each hormone has a specific function in the body and has a specific target cell to which it binds to exert its effect on the cell.

- Each hormone specifically binds to a **target cell**.
- A target cell has receptors on its cell membrane that are designed to respond to that specific hormone.
- When the hormone binds to its receptor, the receptor sends a signal to the cell's nucleus, which then sends a signal to the cell's cytoplasm, resulting in a hormonal response.

Effectors are cells, organs or glands that respond to hormones, producing a response.

ENDOCRINE VS. EXOCRINE GLANDS

Endocrine glands release hormones into the bloodstream to regulate cellular activities throughout the body.

Exocrine glands release substances into the body cavity or onto the surface of the body through a duct.
