

In this practical book, you will find the essential features that need to be taken into consideration during gestation, calving and the postpartum period in order to deal with calving successfully.

3 Physiology of calving: normal delivery

Stages of normal delivery

Calving takes place in three well-defined stages:

1. Distress stage
2. Partial expulsive stage
3. Effortful expulsive stage

Stage	Duration	Signs	Comments
Distress	6-18 hours	Restlessness, reduced feed intake. Usually, the foetal membranes can be seen in the vulva.	Gradually becomes propped up in the pelvic canal.
Partial expulsion	Usually 1-2 hours (Rare: 30 mins-4 hours)	Abdominal contractions that increase in frequency, intensity, regularity, rupture of the foetal membranes and rupture of the foetal sac.	Placenta being pulled down.
Effortful expulsion	Within 12-15 postpartum	Expulsion of the placenta.	Placenta being pulled down.

1. Distress stage

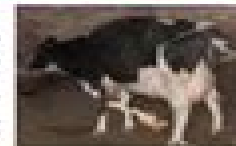

Distress stage: the cow is restless, the vulva is moist and the membranes are visible in the vulva.

- Cow progressively shows signs of distress, usually the sign of it is the position of the vulva, up open 15 and 18 hours before the foetus.
- Characterised by a specific behaviour, restlessness, animal is restless, no interest in feed, no interest in water.
- Repeated series of abdominal contractions of 10-20 minutes.
- During contractions, which are slow, the cow usually shows the signs of distress.
- When the cervix is sufficiently dilated, the membranes and placenta are pulled down and the calf is born.

2. Partial expulsive stage

- Abdominal contractions start as the calf's head passes down the uterus.
- Contractions become more frequent (every 2-3 minutes), last longer and increase in intensity.
- Cow is usually restless, often lying down.
