The three controllers achieve closed-loop H_2 norms of 1.04, 0.07 and 0.03, respectively. Construct closed-loop models and compare the gains from road disturbance to y_1, y_2, y_3 for the passive and active systems. Show that all three controllers reduce suspension deflection and body acceleration below the set points.

So far you have designed H_{∞} controllers that meet the performance objectives for the nominal value (nominal order). This model is only an approximation of the true structure and you need to make sure performance is maintained in the face of model errors and uncertainties. This is called robust performance. Next you will synthesize design H_{∞} controllers that achieve robust performance for the entire family of Δ values. Synthesis is accomplished with the design function using the structured model $\text{sm}(s)$, γ , Δ and “desired” performance (β or β_1).
