**Visual Mismatch Negativity (vMMN): a Prediction Error Signal in the Visual Modality** Gabor Stefanics, István Czigler, 2015-06-04 Current theories of visual change detection emphasize the importance of conscious attention to detect unexpected changes in the visual environment However an increasing body of studies shows that the human brain is capable of detecting even small visual changes especially if such changes violate non conscious probabilistic expectations based on repeating experiences In other words our brain automatically represents statistical regularities of our visual environment Since the discovery of the auditory mismatch negativity MMN event related potential ERP component the majority of research in the field has focused on auditory deviance detection Such automatic change detection mechanisms operate in the visual modality too as indicated by the visual mismatch negativity vMMN brain potential to rare changes VMMN is typically elicited by stimuli with infrequent deviant features embedded in a stream of frequent standard stimuli outside the focus of attention In this research topic we aim to present vMMN as a prediction error signal Predictive coding theories account for phenomena such as mismatch negativity and repetition suppression and place them in a broader context of a general theory of cortical responses A wide range of vMMN studies has been presented in this Research Topic Twelve articles address roughly four general sub themes including attention language face processing and psychiatric disorders Additionally four articles focused on particular subjects such as the oblique effect object formation and development and time frequency analysis of vMMN Furthermore a review paper presented vMMN in a hierarchical predictive coding framework Each paper in this Research Topic is a valuable contribution to the field of automatic visual change detection and deepens our understanding of the short term plasticity underlying predictive processes of visual perceptual learning [The Navy List](#) Great Britain. **Feasible Mathematics** S.R. Buss,P.J. Scott,2013-03-07 A so called effective algorithm may require arbitrarily large finite amounts of time and space resources and hence may not be practical in the real world A feasible algorithm is one which only requires a limited amount of space and or time for execution the general idea is that a feasible algorithm is one which may be practical on today s or at least tomorrow s computers There is no definitive analogue of Church s thesis giving a mathematical definition of feasibility however the most widely studied mathematical model of feasible computability is polynomial time computability Feasible Mathematics includes both the study of feasible computation from a mathematical and logical point of view and the reworking of traditional mathematics from the point of view of feasible computation The diversity of Feasible Mathematics is illustrated by the contents of this volume which includes papers on weak fragments of arithmetic on higher type functionals on bounded linear logic on sub recursive definitions of complexity classes on finite model theory on models of feasible computation for real numbers on vector spaces and on recursion theory The vWorkshop on Feasible Mathematics was sponsored by the Mathematical Sciences Institute and was held at Cornell University June 26 28 1989
