Mass Spectrometry James M. Thompson, 2017-12-22 It is estimated that there are about 10 million organic chemicals known and about 100 000 new organic compounds are produced each year Some of these new chemicals are made in the laboratory and some are isolated from natural products The structural determination of these compounds is the job of the chemist There are several instrumental techniques used to determine the structures of organic compounds These include NMR UV visible infrared spectroscopy mass spectrometry and X ray crystallography Of all the instrumental techniques listed infrared spectroscopy and mass spectrometry are the two most popular techniques mainly because they tend to be less expensive and give us the most structural information This book is an introductory text designed to acquaint undergraduate and graduate students with the basic theory and interpretative techniques of mass spectrometry Much of the material in this text has been used over a period of several years for teaching courses in materials characterization and chemical analysis It presents the mass spectra of the major classes of organic compounds and correlates the fragmentation pattern of each spectrum with the structural features of the compound it represents This has been done

for hydrocarbons organic acids ketones aldehydes esters anhydrides phenols amines and amides The text discusses the origin of the fragments techniques innovations and applications in mass spectrometry It is interspersed with many illustrations examples an adequate but not overwhelming bibliography and problems for students It will serve as a lecture text for a one semester course in mass spectrometry or can be used to teach the mass spectra portion of a broader course in material characterization and chemical analysis
