

Radical reactions: Free-radical polymerisation

The overall "polymerisation" process "chain reaction" is self-sustaining, propagation stage has three sub-steps and forms three new species. Anionic/polymerisation starts by other mechanism, etc. Radical polymerisation can occur without solvent and some propagation stages and radical species have subsequent side change. Radical polymerisation involves three features: 1. sequential chain building stage finally, the process involving our famous propagation.

Radical polymerisation mechanism: 1. Initiation: radical species generated from some source. 2. Propagation: radical species
