Numerical Methods for Roots of Polynomials - Part II J.M. McNamee, V.Y. Pan, 2013-07-19 The zeros of a polynomial can be readily recovered from its linear factors The linear factors can be approximated by first splitting a polynomial numerically into the product of its two nonconstant factors and then recursively splitting every computed nonlinear factor in similar fashion For both the worst and average case inputs the resulting algorithms solve the polynomial factorization and root finding problems within fixed sufficiently small error bounds by using nearly optimal arithmetic and Boolean time that is using nearly optimal numbers of arithmetic and bitwise operations in the case of a polynomial with integer coefficients and simple roots we can immediately extend factorization to root isolation that is to computing disjoint covering discs one for every root on the complex plane The presented algorithms compute highly accurate approximations to all roots nearly as fast as one reads the input coefficients Furthermore our algorithms allow processor efficient parallel acceleration which enables root finding factorization and root isolation in polylogarithmic arithmetic and Boolean time The chapter thoroughly covers the design and analysis of these

algorithms including auxiliary techniques of independent interest At the end we compare the presented polynomial root finders with alternative ones in particular with the popular algorithms adopted by users based on supporting empirical information We also comment on some promising directions to further progress
