Factor Analysis Richard L. Gorsuch, 2014-11-27 Comprehensive and comprehensible this classic text covers the basic and advanced topics essential for using factor analysis as a scientific tool in psychology education sociology and related areas Emphasizing the usefulness of the techniques it presents sufficient mathematical background for understanding and applying its use This includes the theory as well as the empirical evaluations The overall goal is to show readers how to use factor analysis in their substantive research by highlighting when the differences in mathematical procedures have a major impact on the substantive conclusions when the differences are not relevant and when factor analysis might not be the best procedure to use Although the original version was written years ago the book maintains its relevance today by providing readers with a thorough understanding of the basic mathematical models so they can easily apply these models to their own research Readers are presented with a very complete picture of the inner workings of these methods The new Introduction highlights the remarkably few changes that the author would make if he were writing the book today An ideal text for courses on factor analysis or as a supplement for multivariate analysis structural equation modeling or advanced quantitative techniques taught in psychology education and other social and behavioral sciences researchers who use these techniques also appreciate this book's thorough review of the basic models Prerequisites include a graduate level course on statistics and a basic understanding of algebra Sections with an asterisk can be skipped entirely if preferred

Embedded Computing Joseph A. Fisher, Paolo Faraboschi, Cliff Young, 2005-01-19 The fact that there are more embedded computers than general purpose computers and that we are impacted by hundreds of them every day is no longer news What is news is that their increasing performance requirements complexity and capabilities demand a new approach to their design Fisher Faraboschi and Young describe a new age of embedded computing design in which the processor is central making the approach radically distinct from contemporary practices of embedded systems design They demonstrate why it is essential to take a computing centric and system design approach to the traditional elements of nonprogrammable components peripherals interconnects and buses These elements must be unified in a system design with high performance processor architectures microarchitectures and compilers and with the compilation tools debuggers and simulators needed for application development In this landmark text the authors apply their expertise in highly interdisciplinary hardware software development and VLIW processors to illustrate this change in embedded computing VLIW architectures have long been a popular choice in embedded systems design and while VLIW is a running theme throughout the book embedded computing is the core topic Embedded Computing examines both in a book filled with fact and opinion based on the authors many years of R D experience Complemented by a unique professional quality embedded tool chain on the authors website <http://www.vliw.org/book> Combines technical depth with real world experience Comprehensively explains the differences between general purpose computing systems and embedded systems at the hardware software tools and operating system levels Uses concrete examples to explain and motivate the trade offs
