

Assignment Report: Earthquake Damage Assessment Version 3

Residential Neighborhood	Percentage of Homes Damaged	Number of People Needing Emergency Housing
Franklin	40%	40% of 1000 = 400 people
Midway Station	20%	20% of 1000 = 200 people
Palmer	20%	20% of 500 = 100 people
Marshall	40%	40% of 125 = 50 people
Marine Heights	20%	20% of 1000 = 200 people

Note: Values of the number of people needing emergency housing were rounded up.

Please add additional comments and your rationale for your comments.

There are a number of reasons for projected number of people needing emergency housing that we should take into the report specific to the cities' design.

Observations

One concern is the size of the city with the largest number of people projected to need emergency housing. This number is so high due to the high number of infrastructure, specifically cultural districts, and high level of the population. However, this number does not take into account the fact that a little bit of earthquake that goes through the city will cause some which could become more susceptible to damage from future tremors and cracks. Another concern is the cities targeted to be hit by the quake. These observations will show clearly the size of some that will be hit by the earthquake as well as the fact that it may become difficult to provide proper emergency services during this time and during the aftermath of the earthquake.

Natural Hazards: Earth's Processes as Hazards, Disasters, and Catastrophes (4th Edition) Edward Keller, Duane DeVecchio, 2015-05-20 Journal of Geoscience Education, 1996 **The Conterminous United States Mineral Assessment Program** Wayne B. Solley, Robert R. Pierce, Howard A. Perlman, 1984 **The 1755 Lisbon Earthquake: Revisited** Luiz Mendes-Victor, Carlos Sousa Oliveira, João Azevedo, A. Ribeiro, 2008-10-14 The 1755 earthquake and tsunami were influential not only in Portugal but in all European and North African countries where the devastating effects were felt. The entire world was deeply impressed and the discussion of its causes generated a large amount of scientific and metaphysical speculation. It inspired philosophers, poets, and writers. The socio-economic consequences of the event were great and affected the future organization and development of Portugal. The possibility of a similar occurrence urges society and the scientific community to reflect on its lessons. Audience: This work is of interest to experts in seismology, earthquake engineering, civil protection, urban planning, and it is a reference book for doctoral students. **Seismic Risk Assessment and Retrofitting** Alper Ilki, Faruk Karadogan, Sumru Pala, Ercan Yuksel, 2009-10-03 Many more people are coming to live in earthquake-prone areas, especially urban ones. Many such areas contain low-rise, low-cost housing while little money is available to retrofit the buildings to avoid total collapse and thus potentially save lives. The lack of money, especially in developing countries, is exacerbated by difficulties with administration, implementation, and public awareness. The future of modern earthquake engineering will come to be dominated by new kinds of measuring technologies, new materials developed especially for low-rise, low-cost buildings, simpler and thus lower cost options for retrofitting, cost-cutting, and raising public awareness. The book covers all the areas involved in this complex issue: from the prevention of total building collapse through improvement techniques to legal, financial, taxation, and social issues. The contributors have all made valuable contributions in their own particular fields; all of them are or have been closely involved with the issues that can arise in seismic zones in any country. The recent research results published here offer invaluable pointers to practicing engineers and administrators as well as other scientists whose work involves saving the lives and property of the many millions of people who live and work in hazardous buildings. *Earthquake Data in Engineering Seismology* Sinan Akkar, Polat Gülkan, Torild van Eck, 2011-01-03 This book addresses current activities in strong motion networks around the globe, covering issues related to designing, maintaining, and disseminating information from these arrays. The book is divided into three principal sections. The first section includes recent developments in regional and global ground motion predictive models. It presents discussions on the similarities and differences of ground motion estimations from these models and their application to design spectra, as well as other novel procedures for predicting engineering parameters in seismic regions with sparse data. The second section introduces topics about the particular methodologies being implemented in the recently established global and regional strong motion databanks in Europe to maintain and disseminate the archived accelerometric data. The final section describes

major strong motion arrays around the world and their historical developments The last three chapters of this section introduce projects carried out within the context of arrays deployed for seismic risk studies in metropolitan areas Audience This timely book will be of particular interest for researchers who use accelerometric data extensively to conduct studies in earthquake engineering and engineering seismology **Earthquake-Resistant Structures** Mohiuddin Ali Khan, 2013-03-18 Earthquake engineering is the ultimate challenge for structural engineers Even if natural phenomena involve great uncertainties structural engineers need to design buildings bridges and dams capable of resisting the destructive forces produced by them These disasters have created a new awareness about the disaster preparedness and mitigation Before a building utility system or transportation structure is built engineers spend a great deal of time analyzing those structures to make sure they will perform reliably under seismic and other loads The purpose of this book is to provide structural engineers with tools and information to improve current building and bridge design and construction practices and enhance their sustainability during and after seismic events In this book Khan explains the latest theory design applications and Code Provisions Earthquake Resistant Structures features seismic design and retrofitting techniques for low and high rise buildings single and multi span bridges dams and nuclear facilities The author also compares and contrasts various seismic resistant techniques in USA Russia Japan Turkey India China New Zealand and Pakistan Written by a world renowned author and educator Seismic design and retrofitting techniques for all structures Tools improve current building and bridge designs Latest methods for building earthquake resistant structures Combines physical and geophysical science with structural engineering **Geologic Hazards of Monroe City, Sevier County, Utah** Richard E. Giraud, 2004 Geologic hazards are naturally occurring processes that present a risk to life and property This report provides information for the Monroe City area in Utah s central Sevier Valley to reduce losses from geologic hazards Surficial geologic mapping provides the basis on which individual geologic hazards are identified and mapped Alluvial fan and basin fill deposits cover most of the map area Other deposits consist of colluvium artificial fill spring travertine and volcanic bedrock The geologic hazards maps show where hazards may exist The maps should be used to inform citizens and developers of potential risks and for local government officials to make prudent land use planning decisions The maps are general and site specific studies are needed to demonstrate site suitability prior to development Typical risk reduction methods for these geologic hazards generally include avoidance or engineering design to reduce the risk to an acceptable level **Geological Survey Professional Paper** Geological Survey (U.S.), 1998 Assessing Hazard Mitigation , 1995
