**Molecular Genetics and Emerging Therapies for Epithelial Ovarian Cancer: Basic Research and Clinical Perspectives** Stergios Boussios, Eleftherios Pierre Samartzis, Nicholas Pavlidis, J. Alejandro

Perez-Fidalgo, 2023-11-06 Epithelial ovarian cancer EOC is the most lethal gynecological disorder due to a lack of effective early detection strategies Worldwide approximately 230 000 women are diagnosed annually whereas 150 000 die It represents the seventh most commonly diagnosed cancer among women in the world with 5 year survival rate of 46% More than one fifth of EOC have been related to hereditary conditions Considerable efforts have been made to implement screening of the general population to diagnose EOC early nevertheless this has been ineffective and there is no approved strategy Nowadays new approaches for early diagnosis and prevention based on molecular genomics are in development Whole genome sequencing has established the potency of the somatic genome characterised with diverse DNA repair deficiencies that can be used to stratify EOCs into distinct biological groups with predictive signatures of resistance or relapse The incorporation of next generation sequencing NGS into clinical practice remains challenging for two reasons Firstly the EOC risk is not clear for some of the included genes and secondly the variant of uncertain significance rates increase as more genes are analyzed Finally beyond germline pathogenic variants somatic mutations may also affect therapeutic choices and as such upfront tumor sequencing may be equally important to NGS particularly as we continue to challenge treatment paradigms in the first line management of EOC

Systems Biology of MicroRNAs in Cancer Ulf Schmitz, Olaf Wolkenhauer, Julio Vera-González, 2022-11-09 This book provides an update on the latest development in the field of microRNAs in cancer research with an emphasis on translational research Since the early 2000s microRNAs have been recognized as important and ubiquitous regulators of gene expression Soon it became evident that their deregulation can cause human diseases including cancer This book focuses on the emerging opportunities for the application of microRNA research in clinical practice In this context computer models are presented that can help to identify novel biomarkers e g in circulating microRNAs and tools that can help to design microRNA based therapeutic interventions Other chapters evaluate

the role of microRNAs in immunotherapy immune responses and drug resistance Covering key topics on microRNAs in cancer research this book is a valuable resource for both emerging and established microRNA researchers who want to explore the potential of microRNAs as therapeutic targets or co adjuvants in cancer therapies **Research Grants Index** National Institutes of Health (U.S.). **uncommon ovarian cancer types and subtypes** Robb Hollis,Mihaela Carmen Cristea ,Mignon Van Gent,2024-10-22 Ovarian cancer is an umbrella term for a collection of distinct disease entities histotypes Until now the majority of research has focussed on the most common histotype high grade serous ovarian carcinoma HGSOC which accounts for 70% of cases The less common histotypes including endometrioid clear cell mucinous low grade serous carcinosarcoma and non epithelial histotypes have received far less research attention Accordingly while major advances in our understanding of HGSOC have led to molecularly directed therapies that improve patient outcomes progress in less common histotypes has lagged behind Notably many of the uncommon histotypes demonstrate resistance to conventional chemotherapy regimens and their inherent biological differences suggest most are unlikely to respond to emerging molecular therapeutics designed to target the biology of common ovarian cancer types **Research Awards Index** , Epigenetics in Cancer: Mechanisms and Drug Development - Volume II Xiao Zhu,2023-09-27 **Immune Cell Therapy Approaches Targeting Tumor**

**Microenvironment** Jaya Lakshmi Thangaraj,Luigi Cari,Suresh Kalathil,Antoine Toubert,2025-06-12 Immune cell therapy has emerged as a ground breaking approach in the field of cancer treatment focusing on harnessing the power of the body s immune system to combat tumors One promising avenue within this realm is the development of immune cell therapies targeting the tumor microenvironment TME The TME encompasses the complex network of cells blood vessels and signalling molecules that surround a tumor influencing its growth and interaction with the immune system One notable strategy in immune cell therapy is the use of chimeric antigen receptor expressing T cells CAR T cells CAR NK cells dendritic cells and macrophages which are directly engineered to recognize and attack cancer cells within the TME By deploying these engineered immune cells researchers aim to enhance the immune system s ability to infiltrate the TME and eradicate malignant cells Another approach involves utilizing tumor infiltrating lymphocytes TILs which are naturally occurring immune cells found within the tumor Researchers extract and expand these TILs outside the body before reinfusing them back into the patient bolstering the immune response against the tumor This method capitalizes on the inherent specificity of TILs for cancer cells while amplifying their numbers for a more robust and targeted attack In addition to cell based therapies ongoing research focuses on developing immunomodulatory drugs designed to manipulate the TME and create an environment hostile to tumor survival These drugs aim to modulate various components of the TME such as immune

checkpoint inhibitors that release the brakes on immune responses enabling a more potent antitumor effect. The ultimate goal of immune cell therapy targeting the TME is to establish a dynamic and sustained immune response against cancer, fostering long-term remission and potentially even cures. As research progresses, the integration of multiple approaches and the refinement of existing strategies hold promise for revolutionizing cancer treatment and providing new hope for patients facing insurmountable challenges. Immune cell therapy has emerged as a revolutionary approach in cancer treatment with a focus on manipulating the tumor microenvironment (TME) to enhance anti-tumor immune responses. The TME is a complex milieu of cells, including immune cells, stromal cells, and blood vessels, that influences tumor growth and metastasis. Immunotherapies leverage the body's own immune system to target and eliminate cancer cells, offering a promising alternative to traditional treatments. Adoptive cell therapy (ACT) involves isolating and genetically modifying immune cells, such as T cells, NK cells, dendritic cells, and macrophages, to express specific receptors that recognize and attack cancer cells within the TME. Additionally, immune checkpoint inhibitors aim to unleash the immune system by blocking inhibitory signals that tumors exploit to evade detection. These innovative approaches represent a paradigm shift in cancer therapy, harnessing the power of the immune system to reprogram the TME and combat cancer more effectively. Currently, a major challenge in developing immune cell therapies targeting the tumor microenvironment lies in the complexity and heterogeneity of the tumor itself. Tumors create an immunosuppressive microenvironment, hindering the effectiveness of immune cells. Moreover, achieving sustained immune cell persistence within the hostile tumor milieu remains a critical concern. Researchers are actively addressing these challenges through innovative strategies such as enhancing immune cell homing and persistence, refining cell engineering techniques, and deciphering the intricate interactions within the tumor microenvironment. Furthermore, advancements in understanding the intricate interactions within the tumor microenvironment may lead to the development of novel strategies to overcome immunosuppression and improve the overall efficacy of immune cell therapies in treating various types of cancer. This research topic collection aims to investigate the potential of immune cell-based adoptive transfer approaches targeting the tumor microenvironment, a crucial aspect of cancer progression. The collection's scope encompasses a comprehensive exploration of various immune cell types, their interactions within the tumor microenvironment, and their impact on tumor growth and metastasis, as well as potential adoptive cell therapy. Authors are invited to delve into the latest advancements in immunotherapy, seeking to understand how immune cells can be harnessed to modulate the complex dynamics of the tumor microenvironment effectively. The aim of this research topic is therefore to contribute valuable insights that can inform the development of innovative therapeutic strategies, ultimately advancing the field of cancer treatment. By elucidating the intricate interplay between immune cells and the tumor microenvironment, this research topic strives to pave the way for more targeted and immune cell-based therapeutic approaches in cancer immunotherapy. transcriptomic databases which are not accompanied by robust and relevant validation clinical cohort or biological validation in vitro or in vivo are out of scope for this topic Cellular Dynamics within the Tumor Microenvironment Daniela F.
