

MICROBIOLOGY LAB REPORT

INTRODUCTION

Bacterial identification has significant importance in many different industries including the pharmaceutical industry, when considering microbial contamination. Microbial contamination refers to the accidental introduction of an infectious material, such as bacteria, yeast, fungi or virus, to the production line (Donaldson, 2003). By inspecting for microbial contamination in products, it ensures quality control as there won't be any damage, namely in the way of chemical degradation, which can lead to the loss of efficacy as well as toxic side effects and medicine spoilage, all of which can be detrimental to a patient's health. There would also be a great loss in profit therefore it is an essential investment for a pharmaceutical company to take. Analytical techniques, for example, morphological, biochemical and genetic sequencing tests, can be performed in order to identify different types of microorganisms.

By identifying bacteria, sterilisation of products can take place in the hope of removing pathogens and reducing the risk of contamination. Contamination can occur at any stage of production; however companies regularly assess the purity of a product on a frequently timed schedule to ensure an infested product is not shipped. These routine tests are performed on the raw materials as well as the manufactured medicines. By sourcing the microbe's identity, the growth and metabolism can be investigated with the aim of finding an appropriate way to prevent it from growing any further and elimination; this is usually by recognizing the antibiotic which can destroy the cell membrane or the function of the particular pathogen. This can be done by isolating the strain of microbe and exposing it to various different antibiotics and observing and recording the different sensitivities; a popular method involving this is the disk diffusion method. Additionally, this process can reveal which strains of bacteria are resistant to certain sterilisation techniques and antibiotics. This is an important field of research in microbiology as antibiotic resistance is a common clinical issue that is faced today and is of growing concern in the pharmaceutical industry due to the fact that, every year, routinely used antibiotics are becoming redundant in the face of bacterial resistance (Toy, 2008).

METHODS

Refer to the four microbiology laboratory scripts:

1. Aseptic Technique and Examining the Environment
2. Identification 1 (Case Study)
3. Identification 2
4. Antibiotics
