The Mononuclear Phagocyte System in Infectious Disease Geanncarlo Lugo-Villarino, Céline Cougoule, Etienne Meunier, Yoann Rombouts, Christel Vérollet, Luciana Balboa, 2019-10-04

The Mononuclear Phagocyte System MPS of vertebrates is composed of monocytes macrophages and dendritic cells Together they form part of the first line of immune defense against a variety of pathogens bacteria fungi parasites and viruses and thus play an important role in maintaining organism homeostasis The mode of transmission type of replication and mechanism of disease causing differ significantly for each pathogen eliciting a unique immune response in the host Within this context the MPS acts as both the sentinel and tailor of the immune system As sentinels MPS cells are found in blood and within tissues throughout the body to patrol against pathogenic insult The strategy to detect microbial non self relies on MPS to recognize conserved microbial products known as pathogen associated molecular pattern PAMPs PAMPs recognition represents a checkpoint in the response to pathogens and relies on conserved pattern recognition receptors PRRs Upon PRR engagement MPS mount a cell autonomous attack that includes the internalization and compartmentalization of intracellular pathogens into toxic compartments that promote destruction In parallel MPS cells launch an inflammatory response composed of a cellular arm and soluble factors to control extracellular pathogens In cases when innate immunity fails to eliminate the invading microbe MPS serves as a tailor to generate adaptive immunity for pathogen eradication and generation of memory cells thus ensuring enhanced protection against re infection Indeed MPS cell functions comprise the capture process migration and delivery of antigenic information to lymphoid organs where type 1 immunity is tailored against intracellular microbes and type 2 immunity against extracellular pathogens However this potent adaptive immunity is also a double edge sword that can cause aberrant inflammatory disorders like autoimmunity or chronic inflammation For this reason MPS also tailors tolerance immunity against unwanted inflammation Successful clearance of the microbe results in its destruction and proper collection of debris resolution of inflammation and tissue healing for which MPS is essential Reciprocally as part of the evolutionary process taking place in all organisms microbes evolved strategies to circumvent the actions bestowed by MPS cells Multiple pathogens modulate the differentiation maturation and activation programs of the MPS as an efficient strategy to avoid a dedicated immune response Among the most common evasion strategies are the subversion of phagocytosis inhibition of PRR mediated immunity resistance to intracellular killing by reactive oxygen and nitrogen species restriction of phagosome maturation modulation of cellular metabolism and nutrient acquisition regulation of cell death and autophagy and modulation of pro inflammatory responses and hijacking of tolerance mechanisms among others The tenet of this eBook is that a better understanding of MPS in infection will yield insights for development of therapeutics to enhance antimicrobial processes or dampen detrimental inflammation for the host s benefit We believe that contributions to this topic will serve as a platform for discussion and debate about relevant issues and themes in this field Our aim is to bring expert junior and senior scientists to address recent progress highlight critical knowledge gaps foment scientific exchange and establish conceptual frameworks

for future MPS investigation in the context of infectious disease

**Discovery and Synthetic Vaccine Design** Clarisa Beatriz Palatnik-de-Sousa, Irene da Silva Soares, Daniela Santoro

Rosa, 2018-07-12 Since variolation conventional approaches to vaccine development are based on live attenuated inactivated or purified pathogen derived components However effective vaccines against global health threats such as HIV parasite infections and tumors are difficult to achieve On the other hand synthetic vaccines based on immunogenic epitopes offer advantages over traditional vaccines since they are chemically defined antigens free from deleterious effects Additionally in contrast to live attenuated vaccines they do not revert to virulence in immunocompromised subjects and different from genetic vaccines they do not involve ethical questions Traditional vaccines contain PAMPs and induce strong immune responses while recombinant vaccines are less potent In spite of the immunogenic weakness previously attributed to epitope based vaccines a synthetic vaccine containing a 17 amino acid epitope of the *Pseudomonas aeruginosa* Type IV pilus exceeded the protective potential of its cognate protein composed of 115 amino acids Therefore the efficacy yield of a synthetic vaccine can be potentiated by using the proper combination of target epitopes Recent advances in adjuvant development immunogen platforms for DNA vaccines and viral vectors also contributed to optimize immunogenicity Another constraint to the use of epitope vaccines was their restriction to some MHC or HLA phenotypes However epitopes containing 20 or less amino acids of *Plasmodium falciparum* and *Leishmania donovani* bind to multiple HLA DR and MHC receptors Thus synthetic epitope vaccines may better meet the requirements of the regulatory agencies since they have lower costs and are easier to produce The classical experimental approach for the development of an epitope based vaccine involves the use of recombinant domains or overlapping 15 mer peptides spanning the full length of the target antigen and the analysis of the induced antibody and or T cell immune responses in vitro or in vivo On the other hand in silico tools can select peptides that are more likely to contain epitopes reducing the number of sequence candidates T cell epitope prediction dates back to 1980s when the first algorithm was developed based on the identification of amphipathic helical regions on protein antigens Since then new methods based on MHC peptide binding motifs or MHC binding properties have been developed The recent reverse vaccinology concept uses high throughput genome sequencing and bioinformatics tools to identify potential targets of immune responses The feasibility of this approach was shown for the first time in the design of a vaccine against *Neisseria meningitidis* that is now in phase III clinical trials In addition different computational tools allow the determination of crucial genes through comparative analyses between different pathogenic strains Alternatively carbohydrates have been considered as key targets in developing safe and effective vaccines to combat cancer bacterial and viral infections Tumor associated carbohydrate antigens can be coupled covalently to protein carriers to target MHC receptors and improve immunogenicity

and have reached already pre clinical and clinical studies In light of the recent availability of genomic tools we believe that in the near future an increasing number of vaccine candidates composed of defined epitopes will be available for synthetic vaccines showing improved protection

*Predicting Response to Cancer Immunotherapy* Jinghua Pan,Fu Wang,Jian Song,2023-07-11 Immunotherapy has revolutionized the treatment of malignancies Targeting of immune checkpoints cytotoxic T lymphocyte associated protein 4 programmed cell death protein 1 PD 1 and its ligand PD L1 has led to improving survival in a subset of patients Despite their remarkable success clinical benefit remains limited to only a subset of patients A significant limitation behind these current treatment modalities is an irregularity in clinical response which is especially pronounced among checkpoint inhibition Currently relevant predictors of cancer immunotherapy response include microsatellite instability high deficient mismatch repair MSI H dMMR expression of PD L1 tumor mutation burden TMB immune genomic characteristics and tumor infiltrating lymphocytes TILs However none of them have sufficient evidence to be a stratification factor Moreover as the combined strategies for effective cancer immunotherapy had been developed in multiple tumors such as Immunotherapy combined with chemotherapy radiotherapy targeted therapy and anti angiogenesis therapy Therefore the development of novel biomarkers endowed with high sensitivity specificity and accuracy able to identify which patients may truly benefit from the treatment with cancer immunotherapy would allow to refine the therapeutic selection and to better tailor the treatment strategy

**Leishmaniasis: From Innate and Adaptive Immunity to Vaccine Development** Heinrich Korner,Uwe Ritter,2020-01-10 The parasitic disease leishmaniasis in its various clinical manifestations from self resolving skin lesion to deadly systemic infection is a serious health problem in many developing countries and is considered to be a neglected tropical disease by the World Health Organization To date a vaccine is lacking and strategies to treat severe forms of leishmaniasis efficiently are missing Basic research using animal models of experimental visceral or cutaneous leishmaniasis has allowed to dissect the immune response to parasitic pathogens and has contributed substantially to many important paradigm changing insights such as the role of cytokines in helper T cell differentiation and the impact of myeloid cell subsets on innate and adaptive immunity One strength of experimental leishmaniasis is that tissue associated parasites constitute a self renewing antigen reservoir that needs to be controlled by adaptive and innate branches of the immune response Therefore mechanisms involved in wound healing chronic inflammation host pathogen interactions and the development of long lasting memory responses can be interrogated This research topic aims to cover a broad range of important concepts in adaptive and innate immunity to leishmaniasis and will include recent work including vaccine development to understand and fight this tropical disease We welcome both reviews and original research articles that cover the latest breakthroughs in leishmaniasis research We recognize that reproducibility is a fundamental aspect of research and

Transcription factors are nuclear proteins that control the rate of gene expression activating or repressing transcription in a context dependent manner These regulators lie at the heart of most cell fate decisions of immune cells guiding the initiation and maintenance of lineage identity and controlling the cell type specific gene expression that underpins the unique functions of each immune cell lineage As such transcription factors are of critical importance for a healthy immune system with mutation of specific factors leading to immune dysregulation with immunodeficiency and autoimmunity In addition perturbation of transcription factors known to regulate immune cell function have been implicated in the genesis of haematological malignancies through chromosomal translocation over expression or genetic deletion      *Williams*
