

Applications of Area, Length and Distances

1. A sector of a circle is a region of the circle bounded by a central angle and the corresponding arc.

As given in the following activity, between the central angle knowing the sector and the complete circle, there have previously determined a relation that could be written provided that arc length of a circle is called l (given a central angle) value or diameter of circle. This function gives the relation for arc length of a circle of radius r in given below.

$$\text{Arc Length} = \frac{\theta}{360} (\text{circumference of circle})$$

Another way to find given length is to think about part of whole relationships. As you collected that the given table in this previous activity, you discovered that arc length is directly a function of the circle's circumference and can be expressed in terms of π . This relationship can be summarized proportionally as circle of any given radius, r , is below.

$$\frac{\text{Arc Length}}{\text{Circumference of Circle}} = \frac{\theta}{360}$$

Similarly, you discovered a function that could be written provided the arc length by a central angle in a circle of radius of diameter of radius r .

$$(\text{Arc Length for length of Radius}) = \frac{\theta}{360} (\text{circumference of circle})$$

As you collected that for given radius the previous activity, you discovered that, the arc length, area of a circle (or area swept) is proportional to the circle's circumference can be expressed in terms of π . This relationship is summarized proportionally for a circle of any given radius, r below.

$$\frac{\text{Arc Length}}{\text{Circumference of Circle}} = \frac{\theta}{360}$$

Example: (Based on the above facts are necessary.)

1. In the radius of a circle is 4 cm and find the sector of 60 degrees. Find the arc length and area of sector.
