Yaglom, 2009-10-15 The familiar plane geometry of high school figures composed of lines and circles takes on a new life when viewed as the study of properties that are preserved by special groups of transformations No longer is there a single universal geometry different sets of transformations of the plane correspond to intriguing disparate geometries This book is the concluding Part IV of Geometric Transformations but it can be studied independently of Parts I II and III which appeared in this series as Volumes 8 21 and 24 Part I treats the geometry of rigid motions of the plane isometries Part II treats the geometry of shape preserving transformations of the plane similarities Part III treats the geometry of transformations of the plane that map lines to lines affine and projective transformations and introduces the Klein model of non Euclidean geometry The present Part IV develops the geometry of transformations of the plane that map circles to circles conformal or anallagmatic geometry The notion of inversion or reflection in a circle is the key tool employed Applications include ruler and compass constructions and the Poincar model of hyperbolic geometry The straightforward direct presentation assumes only some background in high school geometry and trigonometry Numerous exercises lead the reader to a mastery of the methods and concepts The second half of the book contains detailed solutions of all the problems *Geometric Transformations I-III* Isaak Moiseevich I. M. Yaglom, 1962 **Euclidean and Affine Transformations** P. S. Modenov, A. S. Parkhomenko, 2014-05-12 Geometric Transformations Volume 1 Euclidean and Affine Transformations focuses on the study of coordinates trigonometry transformations and linear equations The publication first takes a look at orthogonal transformations including orthogonal transformations of the first and second kinds representations of orthogonal transformations as the products of fundamental orthogonal transformations and representation of an orthogonal transformation of space as a product of fundamental orthogonal transformations The text then examines similarity and affine transformations Topics include properties of affine mappings Darboux's lemma and its consequences affine transformations in coordinates homothetic transformations similarity transformations of the plane in coordinates and

similarity mapping The book takes a look at the representation of a similarity transformation as the product of a homothetic transformation and an orthogonal transformation application of affine transformations to the investigation of properties of the ellipse and representation of any affine transformation as a product of affine transformations of the simplest types The manuscript is a valuable reference for high school teachers and readers interested in the Euclidean and affine transformations **Transformation Geometry** George Edward Martin,1982 **Geometric Transformations** Petr Sergeevich Modenov,A.
