

Homeostasis (pp. 74-83)

Organisms develop internal mechanisms, often hormonally-mediated, to maintain internal homeostasis.

A regulated variable must be maintained within a normal range of values, relative to set point, or normal range/baseline.

List 4 examples of regulated variables (body/blood levels):

- 1) Temperature
- 2) Blood glucose and composition of body fluids
- 3) Mineral Ions (electrolytes)
- 4) Blood Pressure

Homeostasis is described as a state of homeostatic equilibrium.

Homeostasis is a negative feedback mechanism.

Regulated variable is restored back regulated variable within a normal range by reversing any upward/downward shift in the variable. E.g. if temperature increases then cooling.

Regulated variable is restored after perturbation: stress disturbance and recovery.

A variable increases or decreases the body's response is opposite from the initial event. Homeostasis means the regulated variable is the normal range.

In the body, signals maintain constantly variable body components and send signals to a specific homeostatic mechanism. E.g. decreasing electrolyte levels signals

growth or a cell or tissue that body compensates with the stimulus is there the cell grows.

Receptors transmit an electrical message through neurons of the body's homeostatic system.

Regulated variables homeostatic responses and these help control many body functions.

Reversing the response.
