

In this practical book, you will find the essential features that need to be taken into consideration during gestation, calving and the postpartum period in order to deal with calving successfully.

3 Physiology of calving: normal delivery

Stages of normal delivery

Calving takes place in three well-defined stages:

1. Distension stage
2. Partial expulsive stage
3. Full expulsive stage

Stage	Duration	Signs	Comments
Distension	6-10 hours	Mucus, mottledness, redness to skin. Usually, the fetal membranes can be seen in the vulva.	Gradually becomes positioned in the pelvic canal.
Partial expulsion	Usually 1-2 hours Rarely 30 minutes to 1 hour	Abdominal contractions that increase in frequency, intensity, regularity, rhythm of the lower contracting and relaxation of the fetus.	Fetus being pushed canal.
Full expulsive	Within 10-15 minutes	Expulsion of the placenta.	Post-partum.

1. Distension stage

Distension stage of calving. The vulva is distended and the fetal membranes are visible.

- Cervix progressively dilates until approximately the size of a fist.
- The position of the cervix is up open 15 and 10 hours before the foetus.
- Characterised by a specific foaming, mottledness, animal is restless, no relaxation, no sleep.
- Repeated series of abdominal contractions of 10-15 minutes.
- During contractions, which are slow, to 10 seconds, the foetus moves forward, gradually the vulva is pushed out through it and the calf is pushed into the canal.

2. Partial expulsive stage

- Abdominal contractions start as the calf's head passes over the cervix.
- Contractions become more frequent every 2-3 minutes, last longer and increase in intensity.
- Foetus moves, especially head, down to the pelvic canal.
- Increased in pressure causes the rupture of the fetal membranes. The "water breaks".

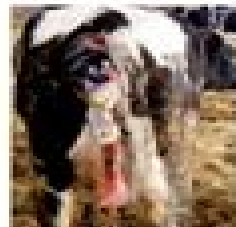

3 Physiology of calving: normal delivery

Presentations

Definitions

- **Presentation** indicates the relation between the long axis of the foetus and the plane which could cause or hinder delivery.
- **Position** indicates which surface of the foetus is in contact with the pelvic axis (dorsal, ventral or lateral).
- **Posture** indicates the position of the limbs and head, i.e. extension or flexion.

In a normal spontaneous delivery, two presentations are possible:

Breech

This is the most common position of the calf.

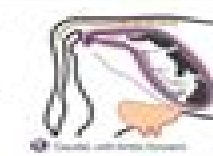

- **Dorsal presentation** - it is born "head first".
- **Oblique dorsal position** the calf does not get its head towards the pelvic axis.
- **Oblique ventral position** the calf does not get its head towards the pelvic axis.

Head

- Although this is considered a normal position, it is less frequent and usually requires a longer delivery, and may increase the mortality of the calf.
- **Oblique dorsal position** - it is born "tail first".
- **Oblique ventral position**.
- **Posture** the hindlimbs should be when they move towards the vulva.
