7. Generator ignition source and pulser coil: testing

1. Both coils are mounted on the generator stator. To remove and refit the assembly refer to the instructions given in Chapter 1, Sections 8 and 12 respectively. Note that a special tool will be required to remove the generator rotor and stator to make test.

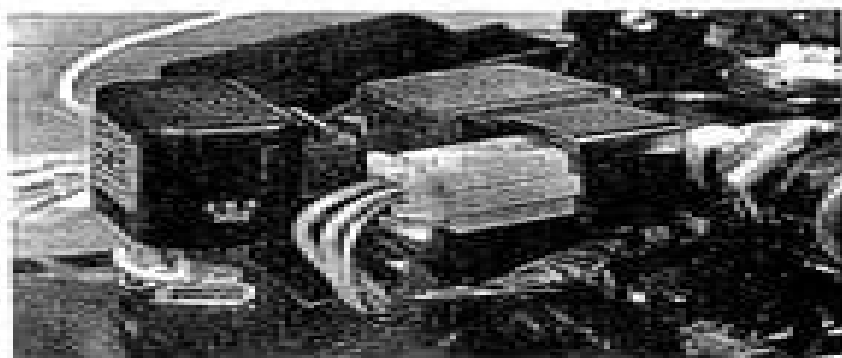

2. To test the coils, unhook and raise the seat, then remove the rear stator and the left-hand rear body cover. See Chapter 4, Section 15. The generator wires are connected to the main wiring loom by four insulated connectors which are protected by a black rubber sheath on the frame left-hand side, just above the engine/transmission unit front mounting. Disconnect the wires for the coil to be tested, see Specifications.

3. Using a multimeter set to the $\times 1$ ohm-resistance range, measure the resistance between a good earth point on the engine/transmission unit and the terminal of the wire which leads to the coil.

4. The actual readings obtained will vary considerably depending on the design of the motor unit, as well as any factors, at the exchange standard define irregularity, such as those specified, the coil should be considered faulty, particularly if the meter registers a short-circuit (no resistance measured) or an open circuit (infinity, or very high resistance).

5. If a coil is thought to be faulty, first check that this is not due to a damaged or broken wire from the coil itself or the connector provided to broken generator lead wires can usually be repaired by the average private owner.

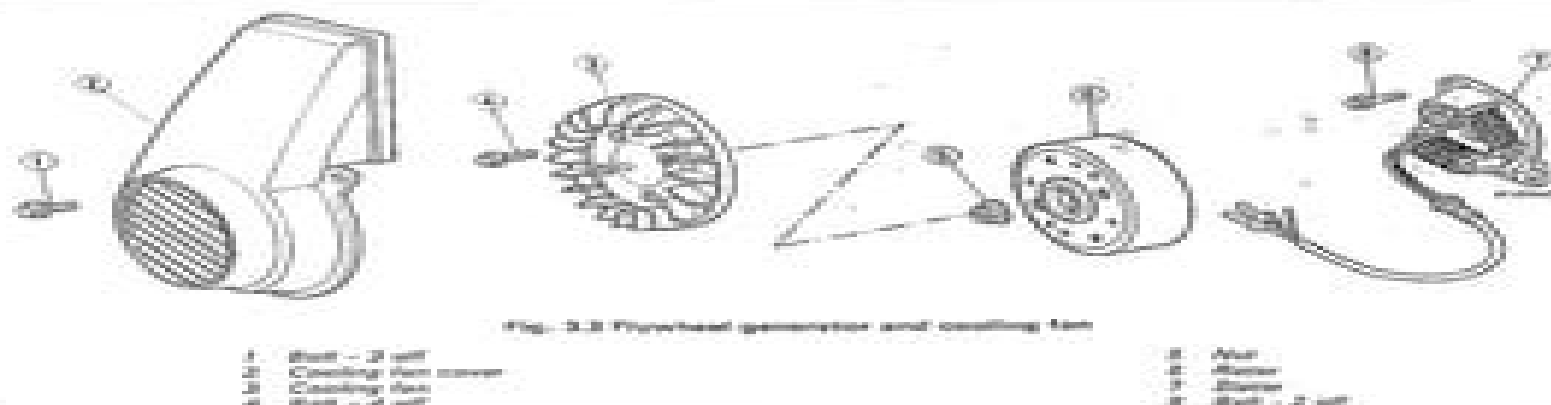

6. If the coil itself appears to be faulty, ask the advice of a good authorised Honda dealer or engine expert who can obtain the test and check your findings. If the coils are faulty they are only available, in genuine Honda replacement parts, as part of the generator stator assembly; this is likely to prove expensive. Several generators have regularly achieved a small re-winding service in the national motorcycle
