

Abstract—The purpose of this study was to determine the effect of a 12-week training program on the heart rate (HR) and energy expenditure (EE) of sedentary, middle-aged women. The subjects were 12 sedentary women, 40 to 50 years of age, who were randomly selected from a telephone directory. The subjects were divided into two groups: a control group and an exercise group. The control group consisted of six women who did not exercise, and the exercise group consisted of six women who exercised for 12 weeks. The exercise group was instructed to exercise for 30 minutes, three times a week, at a heart rate of 150 to 160 beats per minute. The control group was instructed to remain sedentary. The subjects were monitored for 12 weeks. The HR and EE were measured at the beginning and end of the 12-week period. The results showed that the exercise group had a significant increase in HR and EE compared to the control group. The HR of the exercise group increased from 140 to 150 beats per minute, and the EE increased from 1,200 to 1,400 kcal per day. The HR of the control group remained at 140 beats per minute, and the EE remained at 1,200 kcal per day. The results of this study suggest that a 12-week training program can increase the HR and EE of sedentary, middle-aged women.

PUBLISHED WEEKLY

Subscription Information:
The Journal is published weekly, except for two issues combined annually in November and December. The subscription price for 1999 is \$1200 for institutions and \$360 for individuals ordering direct from the publisher and certifying that the Journal is for their personal use. Single copies are \$20. Subscriptions are entered on a calendar year basis. Payment in advance is required. Payment may be made by check, money order, or credit card (VISA, MasterCard, American Express). Subscribers outside the United States and possessions should add \$100 per year for postage. Subscriptions in Canada, Mexico, and other foreign countries should add \$25 per year. Subscriptions in the United States and possessions may be ordered through subscription agents or by mail to the publisher. Subscriptions outside the United States and possessions may be ordered through subscription agents or by mail to the publisher. Subscriptions may be ordered through subscription agents or by mail to the publisher.

Advertising Information:
The Journal has several advertising sections. The most prominent is the "Original Articles" section, which features research articles and clinical studies. Other sections include "Clinical Practice," "Continuing Medical Education," and "Letters to the Editor." Advertisers are encouraged to contact the publisher for more information and rates.

Abstract The purpose of this study was to determine the effect of a 12-week training program on the heart rate (HR) and blood pressure (BP) of sedentary, middle-aged men. The subjects were divided into two groups: a control group and an exercise group. The exercise group performed a 12-week training program consisting of aerobic and resistance exercises. The HR and BP were measured at baseline and at the end of the 12-week program. The results showed that the exercise group had a significant decrease in HR and BP compared to the control group. The HR decreased from 72 to 68 beats per minute, and the BP decreased from 120/80 to 110/70 mmHg. The control group showed no significant changes in HR and BP. The findings suggest that a 12-week training program can effectively reduce HR and BP in sedentary, middle-aged men.

1. **Identify the main components of the circuit.** The circuit consists of a 12V DC source, a 100Ω resistor, a 1kΩ resistor, and a 10V DC source.

2. **Calculate the current flowing through the 100Ω resistor.** The current is 0.01A.

3. **Calculate the voltage across the 1kΩ resistor.** The voltage is 10V.

4. **Calculate the power dissipated by the 100Ω resistor.** The power is 0.001W.

5. **Calculate the power dissipated by the 1kΩ resistor.** The power is 0.1W.

6. **Calculate the total power dissipated by the circuit.** The total power is 0.101W.

7. **Calculate the current flowing through the 10V DC source.** The current is 0.01A.

8. **Calculate the voltage across the 10V DC source.** The voltage is 10V.

9. **Calculate the power dissipated by the 10V DC source.** The power is 0.1W.

10. **Calculate the total power dissipated by the circuit.** The total power is 0.101W.

10. **Answer: D** The patient has a history of aortic aneurysm and is now experiencing chest pain. The most likely cause of the chest pain is aortic dissection. The patient's blood pressure is 180/110 mmHg, which is significantly elevated. The patient's heart rate is 100 bpm, which is also elevated. The patient's oxygen saturation is 92%, which is slightly low. The patient's respiratory rate is 20 breaths per minute, which is slightly elevated. The patient's temperature is 38.5°C, which is slightly elevated. The patient's physical examination is unremarkable. The patient's chest X-ray is unremarkable. The patient's ECG is unremarkable. The patient's laboratory tests are unremarkable. The patient's most likely diagnosis is aortic dissection. The patient's most likely treatment is medical management. The patient's most likely outcome is a good outcome.

Abstract—The purpose of this study was to determine the effect of a 12-week training program on the heart rate (HR) and energy expenditure (EE) of sedentary, middle-aged women. The subjects were 12 sedentary women, 30 to 45 years of age, who were randomly selected from a telephone directory. The subjects were divided into two groups: a control group and a training group. The control group consisted of six women who did not participate in any physical activity during the study. The training group consisted of six women who participated in a 12-week training program. The training program consisted of three sessions per week, each lasting 30 minutes. The sessions were performed on a stationary bike at a heart rate of 150 to 160 beats per minute. The HR and EE were measured at the beginning and end of the study. The HR and EE of the training group increased significantly after 12 weeks of training, while the HR and EE of the control group remained unchanged. The results of this study suggest that a 12-week training program can improve the HR and EE of sedentary, middle-aged women.

Abstract: The purpose of this study was to determine the effect of a 12-week training program on the physical fitness of 10-year-old children. The study was conducted in a primary school in the city of Ankara, Turkey. The study group consisted of 20 children (10 boys and 10 girls) who were randomly selected from the 10-year-old children in the school. The children were divided into two groups: a control group and an experimental group. The control group did not participate in any physical activity during the 12-week period, while the experimental group participated in a 12-week training program. The physical fitness of the children was measured at the beginning and at the end of the 12-week period. The measurements included heart rate, blood pressure, and body mass index. The results of the study showed that the experimental group had significantly higher heart rates and blood pressures at the end of the 12-week period compared to the control group. Additionally, the experimental group had a significantly lower body mass index at the end of the 12-week period compared to the control group. These findings suggest that a 12-week training program can improve the physical fitness of 10-year-old children.

1. **Introduction**
The purpose of this study is to investigate the effects of a new teaching method on student performance in mathematics. The study was conducted over a period of six months, during which time the new method was implemented in a classroom setting. The results of the study are presented in the following sections.

2. **Methodology**
The study employed a quasi-experimental design, comparing the performance of two groups of students: one group that received the new teaching method and another group that received the traditional method. The data was collected through standardized tests and classroom observations.

3. **Results**
The results of the study indicate that the new teaching method had a positive effect on student performance. Students in the new method group showed significantly higher scores on the standardized tests compared to the traditional method group. Additionally, classroom observations revealed that students in the new method group were more engaged and participated more actively in the learning process.

4. **Conclusion**
Based on the findings of this study, it is concluded that the new teaching method is more effective than the traditional method in improving student performance in mathematics. Further research is needed to explore the long-term effects of the new method and to identify the specific factors that contribute to its success.

QUESTION A 60-year-old male with a 20-year history of type 2 diabetes mellitus presents with a 2-week history of increasing fatigue, weight loss, and decreased appetite. He reports that he has been unable to eat as much as he used to and has lost about 10 pounds. He also mentions that he has been feeling increasingly thirsty and has noticed some blurry vision. He has no recent changes in his medications and has been following his diet and exercise regimen. His medical history is significant for type 2 diabetes mellitus, hypertension, and hyperlipidemia. He is currently taking insulin glargine and insulin lispro, lisinopril, and atorvastatin. His last HbA1c was 8.5%.

ANSWER The patient's symptoms of fatigue, weight loss, and decreased appetite, along with his history of type 2 diabetes mellitus and recent HbA1c of 8.5%, suggest a possible complication of diabetes. The most likely diagnosis is diabetic ketoacidosis (DKA), which is a life-threatening condition characterized by hyperglycemia, ketonuria, and metabolic acidosis. The patient's symptoms of increased thirst and blurry vision are also consistent with hyperglycemia. The weight loss and decreased appetite could be due to the body's inability to utilize glucose for energy, leading to the breakdown of fat and muscle for fuel. The patient's history of type 2 diabetes mellitus and recent HbA1c of 8.5% further support this diagnosis. The patient's current medications, including insulin glargine and insulin lispro, should be reviewed to ensure they are being taken correctly and in appropriate doses. The patient should be admitted to the hospital for further evaluation and management, including blood glucose monitoring, fluid resuscitation, and insulin therapy.
