

Boat Performance

Boat Acceleration

WARNING

A tight grip on the steering wheel while handle is always essential and is required when accelerating. Accelerating or when slowing the boat, the handle with Power Trim, when slowing moving speed, the handle should be moved to return a balanced steering position. When slowing steering handle will vary and will put it in one direction until a balanced condition has been obtained. If the outboard is allowed past the fast-speed steering condition, the steering wheel while handle then will have a tendency to put it in the opposite direction. Excessive slowing past the fast-speed steering position will result in unbalanced steering handle, and in most boat applications, a decrease in performance.

CAUTION

When slowing boat with dual outboards, both outboards should be at approximately the same tilt angle and be about out out simultaneously (to prevent boat from pitching side-to-side) with desired boat attitude achieved. Outboards can then be returned individually to precisely adjust boat trim angle and pitch.

1. With boat in water, with the outboard(s) trim button, to remote control handle(s) so that the outboard(s) the side of boat is horizontal. This is a typical average setting that should give reasonable acceleration and top speed.
2. Do for a short familiarization ride of various throttle and trim settings BEFORE starting testing.

NOTE: Instruments should be read with eye directly in front to eliminate any error in reading the instruments.

3. When making either top speed or acceleration runs, best accuracy will be obtained by running with or against any wind. Side winds require driving at a constant turn to keep the boat moving straight-ahead. If winds are 10 MPH (16 km/hr) or greater, it is suggested that all acceleration runs be made downwind.

Boat Test Chart (Example)

Propeller Diameter and Pitch	RPM WOT	RPM WOT	Acceleration Time in Seconds	Propeller Break Loose		Wind during Run		Water Condition	Air Temperature (°F)	Comments
				During Acceleration	During Turns	Direction	gust			
20" x 18" 20" x 18"	2800 2700	26 25	7 8	4gph no	no no	↗	3 3	2" chop 2" chop	73 73	

* WOT is wide-open-throttle

4. Use the speed boat (wide-open-throttle) run should be kept with the boat typically being in straight-ahead during running conditions. (Always keep in gear at WOT) and make 180° degree turns and within the recommended full throttle RPM range listed in the Operation and Maintenance Manual.

NOTE: When performing an acceleration test, it is recommended that a dual outboard be used to maintain steering direction. A dual outboard with a second outboard outboard should be recommended.

5. An acceleration test can also be performed if desired. When the boat with dual outboards in the water and full-throttle is required. A stop watch should be started as the handle is quickly moved to start full-throttle position. Stop the watch as the boat reaches steady speeds past 50 MPH (80 km/hr). Several runs should be made to secure a good average.
6. Prior "break loose" condition higher RPM, if not mentioned, in some cases can be observed during acceleration. If undesirable "break loose" occurs, it can be decreased by trimming the outboard handle up/down. If it remains excessive with all trimmer position, the outboard must be serviced.
7. It is suggested that all appropriate data be recorded on a sheet (such as that illustrated, following) and retained for future reference.
8. After several propellers of different pitch and/or design have been tried, select one that best serves the general purpose of the boat. The selected propeller should enable the engine to operate within its recommended full throttle RPM range, without excessive propeller "break loose" during acceleration or RPM. A second propeller that would make both a reliable spare or a special purpose alternate might also be desirable.

NOTE: A higher pitch often gives best top speed, but the best lower pitch gives adequate top speed with much better acceleration.
