Previous work has shown that the use of a single, standard, 100% scale is not appropriate for all studies. The use of a 100% scale may be inappropriate for studies where the response is not binary (e.g., 'yes/no' or 'agree/disagree') or where the response is not equally likely to be 'yes' or 'no' or 'agree' or 'disagree'. In such cases, the use of a 100% scale may lead to biased results. The use of a 100% scale may also be inappropriate for studies where the response is not equally likely to be 'yes' or 'no' or 'agree' or 'disagree'. In such cases, the use of a 100% scale may lead to biased results.

It is important to note that the results of this study are based on a cross-sectional design. While the data suggest a positive relationship between the variables, the causal direction cannot be definitively established. Future research using longitudinal designs and experimental methods would be beneficial to clarify the nature of the relationship.

Effect of the 1997-98 El Niño shows significant positive responses to El Niño in the Pacific Ocean, especially along the eastern coastline, where there was increased and lasting together in the winter period. In the north, the positive response is also significant, but the positive response is not as strong as in the south.
