

Mitosis:

Q1: What is mitosis? A1: Mitosis is a type of cell division that produces two genetically identical daughter cells from a single parent cell.

Q2: What is the purpose of mitosis? A2: The purpose of mitosis is to facilitate growth, development, and repair of tissues, as well as asexual reproduction in some organisms.

Q3: Which types of cells undergo mitosis? A3: Most cells in the body undergo mitosis, except for reproductive cells (sperm and egg cells) that undergo meiosis.

Q4: What are the stages of mitosis? A4: The stages of mitosis are prophase, metaphase, anaphase, and telophase.

Q5: What happens during prophase? A5: During prophase, the chromatin condenses to form visible chromosomes, the nuclear envelope breaks down, and the mitotic spindle forms.

Q6: What happens during metaphase? A6: During metaphase, the chromosomes line up along the equatorial plane of the cell, and the spindle fibers attach to the centromeres.

Q7: What happens during anaphase? A7: During anaphase, the sister chromatids separate and are pulled to opposite poles of the cell by the shortening of the spindle fibers.

Q8: What happens during telophase? A8: During telophase, the chromosomes reach the opposite poles of the cell, the nuclear envelope reforms, and the chromatin expands.

Q9: What is cytokinesis? A9: Cytokinesis is the division of the cytoplasm that follows mitosis, resulting in the formation of two separate daughter cells.

Q10: How does cytokinesis occur in animal cells? A10: In animal cells, cytokinesis occurs through the formation of a cleavage furrow, which pinches the cell membrane inward to separate the cells.

Q11: How does cytokinesis occur in plant cells? A11: In plant cells, cytokinesis occurs through the formation of a cell plate, which develops into a new cell wall between the daughter cells.

Q12: What is the role of the centrosome in mitosis? A12: The centrosome is involved in the organization of the mitotic spindle and helps separate the chromosomes during mitosis.
